Soil Survey of Washoe County, Nevada, North Part

Part I

How To Use This Soil Survey

This survey is divided into three parts. Part I includes general information about the survey area; descriptions of the detailed soil map units and soil series in the area; and a description of how the soils formed. Part II describes the use and management of the soils and the major soil properties. Part III includes the maps.

The **detailed soil map units** follow the general information about the survey area. These map units can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the **Index to Map Sheets**, note the number of the map sheet, and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Index to Map Units** in Part I of this survey, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Summary of Tables** shows which table has data on a specific land use for each detailed soil map unit. See **Contents** for sections of this publication that may address your specific needs.

A **State Soil Geographic Database (STATSGO)** is available for this survey area. This database consists of a soils map at a scale of 1 to 250,000 and descriptions of groups of associated soils. It replaces the general soil map published in older soil surveys. The map and the database can be used for multicounty planning, and map output can be tailored for a specific use. More information about the State Soil Geographic Database for this survey area, or any portion of Nevada, is available at the local office of the Natural Resources Conservation Service.

Some standards or values may change as more information is collected and analyzed. Thus, as older published interpretive information becomes outdated, new interpretive data must be generated and tailored to local conditions. This information is added to the State Subset of the **Map Unit Interpretation Record (MUIR)** database as needed. Map Unit Interpretation Records are the soil survey specific data and interpretations in the state soil survey database.

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service has leadership for the Federal part of the National Cooperative Soil Survey.

Major fieldwork for this soil survey was completed in 1994. Soil names and descriptions were approved in 1995. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 1994. This survey was made cooperatively by the Natural Resources Conservation, Bureau of Land Management, and University of Nevada Agricultural Experiment Station. It is part of the technical assistance furnished to the Vya Conservation District.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs and marital or familial status. (Not all prohibited bases apply to all programs.) Person with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact the USDA Office of Communications at (202) 720-2791.

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, D.C., 20250, or call 1-800-245-6340 (voice) or 1-800-245-6340 (TDD). USDA is an equal employment opportunity employer.

Foreword

This soil survey contains information that can be used in land-planning programs in Washoe County, Nevada, North Part. It contains predictions of soil behavior for selected land uses. The survey also highlights limitations and hazards inherent in the soil, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Nevada Cooperative Extension.

Soil Survey of Washoe County, Nevada, North Part

By Steve Slusser, Natural Resources Conservation Service

Fieldwork by Steve Slusser and Edward W. Blake, Natural Resources Conservation Service

United States Department of Agriculture, Natural Resources Conservation Service,
in cooperation with the Bureau of Land Management and the University of Nevada
Agricultural Experiment Station

How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area are in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind or segment of the landscape. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landscape, soil scientists develop a concept, or model, of how the soils were formed. Thus, during mapping, this model enables the soil scientists to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Individual soils on the landscape commonly merge into one another as their characteristics gradually change. To construct an accurate map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted color, texture, size,

and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to

year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

The descriptions, names, and delineations of the soils in this survey area do not fully agree with those of the soils in adjacent survey areas. Differences are the result of a better knowledge of soils, modifications in series concepts, or variations in the intensity of mapping or in the extent of the soils in the survey areas.

Denied Access and Areas of Reduced Reliability.

In some small areas of the survey area, access was denied or otherwise restricted. Soil map units were interpolated across the area of denied access using photographic interpretation based on the map units in the adjacent areas. The accuracy of the photo interpretation is dependent on several factors, including the size and complexity of the area; the scale and quality of the photobase; and the degree of relief across the landscape. Because the mapping is made using methods other than field investigation, the reliability of mapping is reduced.

About 20,000 acres in the general vicinity of Vya have been mapped with reduced reliability.

General Nature of the Survey Area

This section gives general information about the survey area. It briefly discusses history; industries, transportation, and recreation; physiography, drainage, and geology; and climate.

History

The original inhabitants of this survey area were the Paiute Indians. John C. Fremont was the first explorer of the area to make recorded observations. He led a party on an expedition to find the legendary Buenaventura River. This river was thought to flow from the Rocky Mountains to San Francisco Bay.

The Applegate Road and Noble Trail were early routes winding westward through the area. They were traveled by thousands of emigrants to northern California. The Applegate Road crosses through the survey area. Noble Trail crosses Black Rock and Smoke Creek Deserts. In 1854, John Dreibelbis surveyed and mapped both of these deserts for the Pacific Railroad. Fortynine Lake was named for an 1849 crossing.

Vya the tiny settlement north of Fortynine Canyon, near the junction of State Routes 8A and 34, in Long Valley was named for Vya Wimer, the first white baby born in the valley. (4)

Massacre Lake is a small lake, or dry sink, east of Vya. A large wagon train was reputedly attacked near there in 1850 by Indians of the High Rock Canyon country. Forty men of the emigrant party were supposed to have been killed in the battle and interred in a common grave. (4)

Industry, Transportation, and Recreation

The Washoe County, Nevada, North Part is an area of sparse population and limited development. The primary industry is livestock production with livestock grazing on federal grazing allotments, administered mainly by the Bureau of Land Management, and on various private holdings scattered throughout the area. Sporadic mining exploration has occurred in the area, but there is presently no active mining on a large scale. The principal mineral in the area is mercury, with widespread occurrences of marginal quality in the Lone Pine mining district. (3)

The major access to the survey area is provided from Denio and Cedarville, California via State Route 8A and from Gerlach via State Route 34. Both are improved gravel roads. Travel on these, and other roads in the survey area, may be restricted during the winter months. Winter travel should be approached with caution.

The survey area is actively used by recreationists, who come to hunt, rock hound, take photographs or simply to enjoy the scenic open spaces in the area. Principal game species include mule deer, pronghorn antelope, upland game birds, and waterfowl. Rock hounds may find obsidian, petrified wood, and various other rocks and minerals. The nearby towns of Gerlach, NV, to the south, Cedarville, CA, to the west, or Denio, NV to the east are the principal sources of fuel and supplies for recreationists and others. There are no such services available in the survey area.

Physiography, Drainage, and Geology

The Washoe county, Nevada, North Part is in the northern portion of the Basin and Range Province (5). It is transitional to the Columbia Plateaus Province. The area is typified by broad, elongated valleys with no external drainage and long mountain ranges running north to south. The north and eastern parts of the area are dominated by dissected plateaus.

The plateaus and mountains are drained by numerous small, intermittent streams and infrequently by perennial streams such as Coleman Creek. Drainages converge in the basins, giving rise to numerous playas and intermittent lakes. During periods of spring runoff these lakes and playas are filled with shallow water, drying out again by late summer in most years. In wet years, some of the deeper lakes may be wet throughout the year. Crooks Lake, Mosquito Lake, Massacre Lake, and Alkali Lake are prominent intermittent lakes in the area.

Volcanic rocks of the Canyon assemblage dominate the geology of the survey area. (3) According to Bonham (3) this assemblage of volcanic rocks is dated from Oligocene to Pliocene with the oldest rocks being dacitic, andesitic, and basaltic flows of Oligocene and Miocene age. These are rather isolated units, located around Bald Mountain, east of Alkali Lake and east of Coleman Canyon.

Rocks of the late Miocene Canón Rhyolite, composed of flows, welded ash-flow tuff, and domes of rhyolite are

abundant near Coleman Creek and to the south and west of Painted Point. Devada, Ninemile, and Hart Camp are typical soils formed on the hard rocks of these areas. Locally, large areas of ash-flow, ash-fall, water-lain tuffs and water re-worked tuffs with small areas of diatomite and tuffaceous sedimentary rocks of late Miocene age occur. Notable areas of these rocks, identified as the High Rock sequence, are found near High Rock Canyon, Fortynine Creek, and Painted Point. Ashone, Tuffo, Saraph, and Hangrock soils are typical of soils formed on the tuffaceous rocks of the High Rock sequence. The youngest rocks of the Canyon assemblage are olivine basalt of late Miocene to Pliocene age. They are extensive around Barrel Springs, Bitner Butte, and capping the peaks of the Hays Canyon Range south of Fortynine Creek. Devada and Ninemile soils are common on these areas.

Quaternary deposits occupy the basins, both as lacustrine deposits from Pleistocene lakes and as more recent alluvial deposits. Remnant lake features are an important part of the landscape in many parts of the area. McWatt, Paypoint, and Langston soils are typical of soils formed in lacustrine deposits from ancient lakes. Soils formed on alluvial fans and fan piedmonts are also common. Fulstone, and Valmy are examples of soils formed in alluvial deposits.

Climate

Table 1 gives data on temperature and precipitation for the survey area as recorded at Vya and Sheldon. Vya is located in the west-central part of the survey area. The Sheldon weather station is located on the Sheldon national

Wildlife Refuge, just east of the survey area. Table 2 shows probable dates of the first freeze in fall and the last freeze in the spring. Table 3 provides data on length of growing season.

Growing degree days, shown in Table 1, are equivalent to "heat units". During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (40 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

In Washoe County, summers are hot, especially at the lower elevations, and winters are cold. At the lower elevations, precipitation is normally light during all months of the year and the land is used mainly for range. At higher elevations, precipitation is much greater and snow accumulates to a considerable depth. Some of the snowmelt irrigates crops in nearby valleys. Climatic data for Vya and Sheldon Nevada, reflect the climatic diversity of the survey area.

In winter, the average temperature is 28 degrees F and the average daily minimum temperature is 19 degrees F at Sheldon and 30 degrees and 18 degrees respectively at Vya. In summer, the average temperature is 58 degrees, F, and the average daily maximum temperature is 75 degrees F at Sheldon and 62 degrees and 80 degrees respectively at Vya.

The total annual precipitation is about 12 inches at Sheldon and 14 inches at Vya, Nevada. About 38 percent of the total usually falls from April through September. The growing season for most crops falls within this period.

Detailed Soil Map Units

The map units on the detailed maps in Part III of this publication represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses. More information about each map unit is given under the headings "Use and Management of the Soils" and "Soil Properties."

A map unit delineation on the detailed soil maps represents an area dominated by one or more soils or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils or miscellaneous areas. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils and miscellaneous areas are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, are mapped without including areas of other taxonomic classes. Consequently, map units are made up of the soils or miscellaneous areas for which they are named and some "included" areas that belong to other taxonomic classes.

Most included soils have properties and behavioral characteristics similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, inclusions. They may or may not be mentioned in the map unit description. Other included soils and miscellaneous areas, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, inclusions. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The included areas of contrasting soils or miscellaneous areas are mentioned in the map unit descriptions. A few included areas may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of included areas in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic

classes but rather to separate the landscape into segments that have similar use and management requirements. The delineation of such landscape segments on the map provides sufficient information for the development of resource plans, but if intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit. The principal hazards and limitations to be considered in planning for specific uses are identified in the tables and narrative in Part II.

Kinds of Map Units

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, wetness, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Some of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, occasionally flooded is a phase of the Wetvit series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes or associations. A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Sough-Rock outcrop complex, 4 to 30 percent slopes is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Saraph-Hangrock-Tuffo association is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Acreage and Extent

Table 4 gives the acreage and proportionate extent of each map unit. Other tables (see "Summary of Tables") give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

Headings and Introductory Phases

In the map unit descriptions that follow, a semitabular format is used. In this format the major headings are centered in the column (for example, *Composition*). They identify the information grouped directly below them. Introducing each item of information under the centered heading is a term or phrase (for example, *Major Components*) that identifies or describes the information. Many of the centered headings and introductory terms are self-explanatory; however, some of them need further explanation and are defined in the Glossary. Explanations of the headings and introductory phrases are provided in the following paragraphs, generally in the order in which they are used in the map unit descriptions.

Composition is given for the components (soils or miscellaneous areas) identified in the name of the map unit as well as for the contrasting inclusions.

Contrasting Inclusions are areas of components that differ sufficiently in use and management from the soils or miscellaneous areas for which the map unit is named. As was explained earlier, inclusions can either be *similar* or *contrasting*. Note that in the *Composition* section a single percentage is provided for a named soil and its similar inclusions because their use and management are similar.

Map Unit Setting is given for the entire map unit. This section gives the position on the landscape. The landscape positions given for the entire map unit generally are broader than those given for each component. Below the map unit setting, the position of each component and inclusion is listed, and the physiographic location of each is identified.

Major Component Description lists the characteristics of the major components. These include elevation, texture of the surface layer, drainage class, parent material, and climatic data.

Dominant Present Vegetation lists the common plants growing on each soil at the present time. The present vegetation may be similar to the potential native plant community, but in some areas it consists of other plants, either cultivated or wild, that dominate the soils in the map unit.

Ecological Site is the assigned rangeland or grazed forest land ecological site that identifies a unique potential native plant community. The plant species and production typical of each ecological site are listed by map unit in the section "Rangeland Plants and Woodland Understory." Additional information about these sites is provided under the heading "Rangeland and Grazeable Woodland Resource Management" in Part II of this publication. Further information also can be obtained from the local office of the Natural Resources Conservation Service.

Map Unit Descriptions

1010--Macyflet-Boulder Lake association

Composition

Major Components

Macyflet silty clay loam, 0 to 2 percent slopes--50 percent
Boulder Lake silty clay, 0 to 2 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Paypoint gravelly sandy loam, 0 to 2 percent slopes--10 percent
Inclusion 2: Davey loamy fine sand, 2 to 8 percent slopes--5 percent

Map Unit Setting

Landscape position: Bolsons
Macyflet--Landform: Alluvial flats
Boulder Lake--Landform: Alluvial flats
Inclusion 1--Landform: Lagoons
Inclusion 2--Landform: Beach terraces

Major Component Description

Macyflet Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 80 days
Surface layer texture: Silty clay loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Boulder Lake Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 80 days
Surface layer texture: Silty clay
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from mixed rocks and lake sediments

Dominant Present Vegetation

Macyflet: Thurber needlegrass, alkali sagebrush, bluegrass
Boulder Lake: Bluegrass, silver sagebrush
Inclusion 1: Douglas rabbitbrush, basin wildrye, big sagebrush
Inclusion 2: Indian ricegrass, basin big sagebrush, needleandthread

Ecological Site

Macyflet: 023XY090NV
Boulder Lake: 023XY003NV
Inclusion 1: 023XY082NV
Inclusion 2: 023XY051NV

1011--Macyflet silt loam, 0 to 2 percent slopes**Composition****Major Components**

Macyflet silt loam, 0 to 2 percent slopes--90 percent

Contrasting Inclusions

Inclusion 1: Boulder Lake silt loam, 0 to 2 percent slopes--6 percent

Inclusion 2: Paypoint gravelly sandy loam, 0 to 2 percent slopes--4 percent

Map Unit Setting

Landscape position: Bolsons

Macyflet--Landform: Basin floors

Inclusion 1--Landform: Lake plains; shape of slope: concave

Inclusion 2--Landform: Lagoons

Major Component Description**Macyflet Series**

Elevation: 5,700 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 43 degrees

Frost-free season: About 80 days

Surface layer texture: Silt loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Macyflet: Cusick bluegrass, Thurber needlegrass, alkali sagebrush, basin wildrye

Inclusion 1: Bluegrass, silver sagebrush

Inclusion 2: Basin wildrye, big sagebrush, rabbitbrush

Ecological Site

Macyflet: 023XY090NV

Inclusion 1: 023XY003NV

Inclusion 2: 023XY082NV

1012--Macyflet-Indian Creek association**Composition****Major Components**

Macyflet silt loam, 0 to 2 percent slopes--45 percent

Indian Creek very cobbly loam, 2 to 8 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Davey loamy fine sand, 2 to 8 percent slopes--6 percent

Inclusion 2: Schamp loam, 4 to 15 percent slopes--5 percent

Inclusion 3: Emagert silt loam, 0 to 2 percent slopes--4 percent

Map Unit Setting

Landscape position: Bolsons

Macyflet--Landform: Lake plains

Indian Creek--Landform: Fan skirts

Inclusion 1--Landform: Beach terraces

Inclusion 2--Landform: Hills; geomorphic position: toeslope

Inclusion 3--Landform: Stream terraces

Major Component Description**Macyflet Series**

Elevation: 5,700 to 6,000 feet

Precipitation: About 12 inches

Air temperature: About 43 degrees

Frost-free season: About 80 days

Surface layer texture: Silt loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from lacustrine sediments

Indian Creek Series

Elevation: 5,700 to 6,000 feet

Precipitation: About 11 inches

Air temperature: About 48 degrees

Frost-free season: About 90 days

Surface rock fragments: 20 percent cobbles; 15 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Macyflet: Cusick bluegrass, Douglas rabbitbrush, Thurber needlegrass, alkali sagebrush, basin wildrye

Indian Creek: Thurber needlegrass, bluegrass, low sagebrush

Inclusion 1: Basin big sagebrush, needlegrass

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush

Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

Macyflet: 023XY090NV

Indian Creek: 023XY059NV

Inclusion 1: 023XY051NV

Inclusion 2: 023XY006NV

Inclusion 3: 023XY009NV

1015--Powlow very gravelly loam, 2 to 15 percent slopes**Composition****Major Components**

Powlow very gravelly loam, 2 to 15 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Old Camp very cobbly loam, 4 to 15 percent slopes--6 percent

Inclusion 2: Saraph very gravelly sandy loam, 8 to 30 percent slopes--4 percent

Inclusion 3: Powlow very gravelly loam, 15 to 30 percent slopes--3 percent

Inclusion 4: Esmod very gravelly fine sandy loam, 2 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
Powlow--Landform: Alluvial fans
Inclusion 1--Landform: Plateaus; geomorphic position: summit
Inclusion 2--Landform: Plateaus; geomorphic position: summit
Inclusion 3--Landform: Fan remnants; geomorphic position: backslope
Inclusion 4--Landform: Fan remnants; geomorphic position: summit

Major Component Description**Powlow Series**

Elevation: 5,600 to 5,800 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 2 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks

Dominant Present Vegetation

Powlow: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
Inclusion 2: Wyoming big sagebrush, bluegrass
Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
Inclusion 4: Thurber needlegrass, bluegrass, low sagebrush

Ecological Site

Powlow: 023XY020NV
Inclusion 1: 023XY006NV
Inclusion 2: 023XY006NV
Inclusion 3: 023XY020NV
Inclusion 4: 023XY059NV

1020--Bearbutte-Welch association**Composition****Major Components**

Bearbutte fine sandy loam, 4 to 15 percent slopes--75 percent
Welch loam, 0 to 4 percent slopes, rarely flooded--15 percent

Contrasting Inclusions

Inclusion 1: Ashone very gravelly fine sandy loam, 4 to 30 percent slopes--6 percent
Inclusion 2: Ashdos very gravelly sandy loam, 4 to 30 percent slopes--3 percent
Inclusion 3: Surprise gravelly loamy sand, 2 to 15 percent slopes--1 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
Bearbutte--Landform: Hills

Welch--Landform: Drainageways

Inclusion 1--Landform: Hills; geomorphic position: backslope; aspect: south
Inclusion 2--Landform: Hills; geomorphic position: backslope; aspect: north
Inclusion 3--Landform: Inset fans

Major Component Description**Bearbutte Series**

Elevation: 6,000 to 6,200 feet
Precipitation: About 13 inches
Air temperature: About 43 degrees
Frost-free season: About 80 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from tuffaceous rocks

Welch Series

Elevation: 6,000 to 6,200 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 60 days
Surface layer texture: Loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from volcanic rocks

Dominant Present Vegetation

Bearbutte: Idaho fescue, Thurber needlegrass, antelope bitterbrush, mountain big sagebrush
Welch: Nevada bluegrass, sedge
Inclusion 1: Idaho fescue, Thurber needlegrass, bluebunch wheatgrass, low sagebrush
Inclusion 2: Idaho fescue, Thurber needlegrass, low sagebrush
Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Bearbutte: 023XY066NV
Welch: 023XY013NV
Inclusion 1: 023XY078NV
Inclusion 2: 023XY079NV
Inclusion 3: 023XY020NV

1025--Mesman fine sandy loam, 0 to 4 percent slopes**Composition****Major Components**

Mesman fine sandy loam, 0 to 4 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--6 percent
Inclusion 2: Langston gravelly sandy loam, 2 to 8 percent slopes--5 percent
Inclusion 3: McWatt extremely stony loam, 4 to 8 percent slopes--2 percent

Inclusion 4: Valmy sandy loam, 2 to 4 percent slopes--2 percent

Map Unit Setting

Landscape position: Bolsons
Mesman--Landform: Lake terraces
Inclusion 1--Landform: Lagoons
Inclusion 2--Landform: Longshore bars (relict)
Inclusion 3--Landform: Beach terraces
Inclusion 4--Landform: Beach terraces

Major Component Description

Mesman Series

Elevation: 4,580 to 4,600 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Mesman: Thurber needlegrass, Wyoming big sagebrush
Inclusion 1: Basin big sagebrush, basin wildrye, bottlebrush squirreltail
Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
Inclusion 3: Wyoming big sagebrush, bottlebrush squirreltail
Inclusion 4: Basin wildrye, big sagebrush, black greasewood

Ecological Site

Mesman: 023XY006NV
Inclusion 1: 023XY082NV
Inclusion 2: 023XY006NV
Inclusion 3: 023XY006NV
Inclusion 4: 024XY022NV

1030--Zorravista fine sand, 4 to 15 percent slopes

Composition

Major Components

Zorravista fine sand, 4 to 15 percent slopes--90 percent

Contrasting Inclusions

Inclusion 1: Davey loamy fine sand, 2 to 15 percent slopes--6 percent
Inclusion 2: Corral loamy fine sand, 2 to 15 percent slopes--3 percent
Inclusion 3: Buffaran stony loam, 2 to 8 percent slopes--1 percent

Map Unit Setting

Landscape position: Intermontane basins
Zorravista--Landform: Dunes
Inclusion 1--Landform: Beach terraces
Inclusion 2--Landform: Pediments
Inclusion 3--Landform: Alluvial fans

Major Component Description

Zorravista Series

Elevation: 5,800 to 5,900 feet
Precipitation: About 9 inches
Air temperature: About 48 degrees
Frost-free season: About 90 days
Surface layer texture: Fine sand
Drainage class: Excessively drained
Dominant parent material: Eolian material

Dominant Present Vegetation

Zorravista: Indian ricegrass, basin big sagebrush, needleandthread
Inclusion 1: Indian ricegrass, basin big sagebrush, needleandthread
Inclusion 2: Indian ricegrass, needleandthread, Wyoming big sagebrush
Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Ecological Site

Zorravista: 023XY011NV
Inclusion 1: 023XY051NV
Inclusion 2: 023XY051NV
Inclusion 3: 023XY006NV

1035--Ninemile-Madeline-Crocan association

Composition

Major Components

Ninemile very cobbly loam, 4 to 30 percent slopes--40 percent
 Madeline very stony loam, 4 to 30 percent slopes--25 percent
 Crocan extremely stony loam, 2 to 15 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Vertic Palexerolls, very-fine, montmorillonitic, frigid very cobbly loam, 0 to 8 percent slopes--6 percent
Inclusion 2: Badgercamp bouldery loam, 4 to 30 percent slopes--4 percent
Inclusion 3: Typic Argixerolls, fine, montmorillonitic, frigid very stony loam, 15 to 30 percent slopes--3 percent
Inclusion 4: Newlands stony loam, 8 to 30 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
Ninemile--Landform: Plateaus
Madeline--Landform: Plateaus; geomorphic position: backslope
Crocan--Landform: Plateaus; geomorphic position: shoulder
Inclusion 1--Landform: Plateaus; geomorphic position: backslope
Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
Inclusion 3--Landform: Plateaus; geomorphic position: backslope

Inclusion 4--Landform: Plateaus; geomorphic position: backslope; aspect: north

Major Component Description

Ninemile Series

Elevation: 6,100 to 6,500 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 75 days
Surface rock fragments: 20 percent cobbles; 30 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Madeline Series

Elevation: 6,100 to 6,500 feet
Precipitation: About 13 inches
Air temperature: About 44 degrees
Frost-free season: About 80 days
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Crocen Series

Elevation: 6,100 to 6,500 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days
Surface rock fragments: 10 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Extremely stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Madeline: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Crocan: Cusick bluegrass, Idaho fescue, bluebunch wheatgrass, low sagebrush, western juniper
 Inclusion 1: Idaho fescue, low sagebrush
 Inclusion 2: Bluegrass, curlleaf mountainmahogany, mountain big sagebrush
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, bluegrass, mountain big sagebrush, western juniper
 Inclusion 4: Idaho fescue, mountain big sagebrush, needlegrass, snowberry

Ecological Site

Ninemile: 023XY017NV
 Madeline: 023XY015NV
 Crocan: 023XY095NV
 Inclusion 1: 023XY014NV
 Inclusion 2: 023XY026NV
 Inclusion 3: 023XY024NV
 Inclusion 4: 023XY065NV

1036--Tinpan-Ninemile association

Composition

Major Components

Tinpan extremely cobbly loam, 0 to 8 percent slopes--50 percent
 Ninemile very cobbly loam, 2 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Karlo very cobbly clay, 0 to 4 percent slopes--9 percent
 Inclusion 2: Crocan extremely stony loam, 2 to 15 percent slopes--4 percent
 Inclusion 3: Vertic Palexerolls, very-fine, montmorillonitic, frigid very stony loam, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
 Tinpan--Landform: Plateaus; shape of slope: concave
 Ninemile--Landform: Plateaus; shape of slope: convex
 Inclusion 1--Landform: Plateaus; shape of slope: concave
 Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
 Inclusion 3--Landform: Plateaus; geomorphic position: summit; shape of slope: concave

Major Component Description

Tinpan Series

Elevation: 6,000 to 6,800 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days
Surface rock fragments: 40 percent cobbles; 20 percent gravel
Surface layer texture: Extremely cobbly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks

Ninemile Series

Elevation: 6,000 to 6,800 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 75 days
Surface rock fragments: 20 percent cobbles; 30 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Tinpan: Idaho fescue, bluebunch wheatgrass, bluegrass, low sagebrush
 Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 1: Bluegrass, low sagebrush, rubber rabbitbrush
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush, western juniper
 Inclusion 3: Idaho fescue, bluegrass, low sagebrush

Ecological Site

Tinpan: 023XY017NV
 Ninemile: 023XY017NV
 Inclusion 1: 023XY001NV
 Inclusion 2: 023XY095NV
 Inclusion 3: 023XY014NV

1040--Langston gravelly sandy loam, 2 to 8 percent slopes**Composition****Major Components**

Langston gravelly sandy loam, 2 to 8 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Davey loamy fine sand, 2 to 15 percent slopes--8 percent
 Inclusion 2: Longdis silty clay loam, 0 to 2 percent slopes--7 percent

Map Unit Setting

Landscape position: Intermontane basins
 Langston--Landform: Longshore bars (relict)
 Inclusion 1--Landform: Beach terraces
 Inclusion 2--Landform: Lake terraces; position on slope: lower

Major Component Description**Langston Series**

Elevation: 5,400 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Dominant Present Vegetation

Langston: Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 1: Basin big sagebrush, needleandthread
 Inclusion 2: Big sagebrush, black greasewood

Ecological Site

Langston: 023XY006NV
 Inclusion 1: 023XY051NV
 Inclusion 2: 024XY022NV

1041--Langston-Old Camp-Paypoint association**Composition****Major Components**

Langston gravelly sandy loam, 2 to 15 percent slopes--45 percent
 Old Camp very gravelly loam, 4 to 15 percent slopes--30 percent
 Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Davey loamy fine sand, 2 to 8 percent slopes--5 percent
 Inclusion 2: Weezweed loam, 0 to 2 percent slopes--3 percent
 Inclusion 3: Emagert loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
 Langston--Landform: Longshore bars (relict)
 Old Camp--Landform: Plateaus
 Paypoint--Landform: Lagoons
 Inclusion 1--Landform: Beach terraces
 Inclusion 2--Landform: Stream terraces
 Inclusion 3--Landform: Stream terraces; position on slope: lower

Major Component Description**Langston Series**

Elevation: 5,700 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Old Camp Series

Elevation: 5,700 to 5,800 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Paypoint Series

Elevation: 5,700 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Langston: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail
 Old Camp: Thurber needlegrass, Wyoming big sagebrush
 Paypoint: Thurber needlegrass, basin wildrye, big sagebrush, bottlebrush squirreltail, rubber rabbitbrush
 Inclusion 1: Indian ricegrass, basin big sagebrush, needlegrass
 Inclusion 2: Basin big sagebrush, basin wildrye, rubber rabbitbrush
 Inclusion 3: Basin big sagebrush, basin wildrye, rubber rabbitbrush

Ecological Site

Langston: 023XY006NV
 Old Camp: 023XY006NV
 Paypoint: 023XY082NV
 Inclusion 1: 023XY051NV
 Inclusion 2: 023XY005NV
 Inclusion 3: 023XY009NV

1045--Paypoint-Langston association**Composition****Major Components**

Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--60 percent
 Langston gravelly sandy loam, 2 to 8 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Longdis silty clay loam, 0 to 2 percent slopes--9 percent
 Inclusion 2: Davey loamy fine sand, 0 to 4 percent slopes--5 percent
 Inclusion 3: Aridic Haploxerolls, fine, montmorillonitic, mesic silt loam, 0 to 2 percent slopes--1 percent

Map Unit Setting

Landscape position: Intermontane basins
 Paypoint--Landform: Lagoons
 Langston--Landform: Longshore bars (relict)
 Inclusion 1--Landform: Lake terraces; position on slope: lower
 Inclusion 2--Landform: Beach terraces
 Inclusion 3--Landform: Drainageways

Major Component Description**Paypoint Series**

Elevation: 5,500 to 5,700 feet
Precipitation: About 9 inches

Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Langston Series

Elevation: 5,500 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 25 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Dominant Present Vegetation

Paypoint: Douglas rabbitbrush, basin wildrye, big sagebrush, bottlebrush squirreltail, rubber rabbitbrush
 Langston: Wyoming big sagebrush, bottlebrush squirreltail
 Inclusion 1: Big sagebrush, black greasewood
 Inclusion 2: Basin big sagebrush, needleandthread
 Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

Paypoint: 023XY082NV
 Langston: 023XY006NV
 Inclusion 1: 024XY022NV
 Inclusion 2: 023XY051NV
 Inclusion 3: 023XY005NV

1050--Skullwak silt loam, 0 to 2 percent slopes**Composition****Major Components**

Skullwak silt loam, 0 to 2 percent slopes--90 percent

Contrasting Inclusions

Inclusion 1: Updike silt loam, 0 to 2 percent slopes--6 percent
 Inclusion 2: Longdis fine sandy loam, 0 to 2 percent slopes--4 percent

Map Unit Setting

Landscape position: Bolsons
 Skullwak--Landform: Basin floors
 Inclusion 1--Landform: Lake terraces
 Inclusion 2--Landform: Lake terraces

Major Component Description**Skullwak Series**

Elevation: 5,500 to 5,600 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface layer texture: Silt loam
Drainage class: Poorly drained

Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Skullwak: Nevada bluegrass, alkaligrass, inland saltgrass
Inclusion 1: Black greasewood, inland saltgrass
Inclusion 2: Big sagebrush, black greasewood

Ecological Site

Skullwak: 023XY002NV
Inclusion 1: 023XY010NV
Inclusion 2: 024XY022NV

1055--Devada-Hapgood-Hart Camp association

Composition

Major Components

Devada very gravelly loam, 15 to 50 percent slopes--40 percent
Hapgood very gravelly loam, 15 to 30 percent slopes--30 percent
Hart Camp stony loam, 4 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Argixerolls, loamy-skeletal, mixed, frigid very gravelly loam, 15 to 50 percent slopes--7 percent
Inclusion 2: Ninemile very stony loam, 15 to 30 percent slopes--4 percent
Inclusion 3: Vitritorrandic Haploxerolls, Ashy, mesic loam, 2 to 15 percent slopes--4 percent

Map Unit Setting

Landscape position: Plateaus and mountains
Devada--Landform: Mountains; geomorphic position: backslope; aspect: south
Hapgood--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave; aspect: north
Hart Camp--Landform: Plateaus; geomorphic position: toeslope; position on slope: lower; aspect: south
Inclusion 1--Landform: Mountains; geomorphic position: summit; position on slope: upper
Inclusion 2--Landform: Plateaus; geomorphic position: backslope
Inclusion 3--Landform: Inset fans; shape of slope: concave

Major Component Description

Devada Series

Elevation: 6,300 to 6,800 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 2 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Hapgood Series

Elevation: 6,300 to 6,800 feet
Precipitation: About 14 inches

Air temperature: About 42 degrees
Frost-free season: About 60 days
Surface rock fragments: 2 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Hart Camp Series

Elevation: 6,300 to 6,800 feet
Precipitation: About 11 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days
Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Devada: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
Hapgood: Idaho fescue, mountain big sagebrush, mountain brome, snowberry
Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
Inclusion 1: Idaho fescue, low sagebrush
Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush
Inclusion 3: Basin wildrye, big sagebrush

Ecological Site

Devada: 023XY031NV
Hapgood: 023XY065NV
Hart Camp: 023XY015NV
Inclusion 1: 023XY008NV
Inclusion 2: 023XY017NV
Inclusion 3: 023XY009NV

1060--Bombadil-Chime association

Composition

Major Components

Bombadil very stony loam, 4 to 30 percent slopes--60 percent
Chime gravelly loam, 2 to 15 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Corral very stony loam, 15 to 30 percent slopes--7 percent
Inclusion 2: Schamp loam, 2 to 15 percent slopes--5 percent
Inclusion 3: McConnel gravelly sandy loam, 0 to 2 percent slopes, occasionally flooded--3 percent

Map Unit Setting

Landscape position: Plateaus
Bombadil--Landform: Plateaus; aspect: south
Chime--Landform: Plateaus; geomorphic position: backslope

Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: northeast
 Inclusion 2--Landform: Hills
 Inclusion 3--Landform: Inset fans

Major Component Description

Bombadil Series

Elevation: 4,700 to 5,000 feet
 Precipitation: About 10 inches
 Air temperature: About 45 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 5 percent stones and boulders; 10 percent cobbles; 25 percent gravel
 Surface layer texture: Very stony loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Chime Series

Elevation: 4,700 to 5,000 feet
 Precipitation: About 9 inches
 Air temperature: About 47 degrees
 Frost-free season: About 100 days
 Surface rock fragments: 20 percent gravel
 Surface layer texture: Gravelly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Bombadil: Wyoming big sagebrush, spiny hopsage
 Chime: Wyoming big sagebrush, spiny hopsage
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

Bombadil: 024XY020NV
 Chime: 024XY020NV
 Inclusion 1: 023XY006NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY005NV

1061--Old Camp gravelly loam, 8 to 30 percent slopes

Composition

Major Components

Old Camp gravelly loam, 8 to 30 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Schamp very stony loam, 4 to 15 percent slopes--7 percent
 Inclusion 2: Corral very stony loam, 15 to 30 percent slopes--4 percent
 Inclusion 3: Bombadil very gravelly loam, 4 to 15 percent slopes--4 percent

Map Unit Setting

Landscape position: Plateaus
 Old Camp--Landform: Plateaus

Inclusion 1--Landform: Hills; geomorphic position: backslope; position on slope: lower
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope
 Inclusion 3--Landform: Plateaus; position on slope: lower; aspect: southwest

Major Component Description

Old Camp Series

Elevation: 5,200 to 5,500 feet
 Precipitation: About 10 inches
 Air temperature: About 45 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 5 percent cobbles; 20 percent gravel
 Surface layer texture: Gravelly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Old Camp: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Wyoming big sagebrush, spiny hopsage

Ecological Site

Old Camp: 023XY006NV
 Inclusion 1: 023XY006NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 024XY020NV

1062--Old Camp-Corral association

Composition

Major Components

Old Camp very cobbly loam, 4 to 15 percent slopes--50 percent

Corral stony loam, 4 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Pachic Argixerolls, loamy-skeletal, mixed, frigid very stony loam, 15 to 30 percent slopes--7 percent
 Inclusion 2: Lithic Xeric Haplargids, loamy, mixed, mesic very cobbly loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Bucklake very cobbly loam, 15 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
 Old Camp--Landform: Plateaus; geomorphic position: summit
 Corral--Landform: Plateaus; geomorphic position: backslope
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: north
 Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
 Inclusion 3--Landform: Plateaus; geomorphic position: backslope

Major Component Description**Old Camp Series***Elevation:* 5,500 to 5,700 feet*Precipitation:* About 10 inches*Air temperature:* About 45 degrees*Frost-free season:* About 90 days*Surface rock fragments:* 1 percent stones and boulders; 25 percent cobbles; 15 percent gravel*Surface layer texture:* Very cobbly loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from volcanic rocks**Corral Series***Elevation:* 5,500 to 5,700 feet*Precipitation:* About 9 inches*Air temperature:* About 45 degrees*Frost-free season:* About 80 days*Surface rock fragments:* 3 percent stones and boulders; 10 percent cobbles; 10 percent gravel*Surface layer texture:* Stony loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Dominant Present Vegetation**

Old Camp: Thurber needlegrass, Wyoming big sagebrush

Corral: Thurber needlegrass, Wyoming big sagebrush

Inclusion 1: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Thurber needlegrass, low sagebrush

Inclusion 3: Big sagebrush, bluebunch wheatgrass

Ecological Site

Old Camp: 023XY006NV

backslope; position on slope: upper; *aspect:* south

Rubble land--Landform: Plateaus

Inclusion 1--Landform: Plateaus; geomorphic position:

shoulder; aspect: south

Inclusion 2--Landform: Plateaus; geomorphic position:

backslope; position on slope: upper; *shape of slope:* convex

Inclusion 3--Landform: Stream terraces

Inclusion 4--Landform: Stream terraces

Major Component Description**Old Camp Series**

Elevation: 5,000 to 6,000 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 15 percent stones and boulders;

 20 percent cobbles; 20 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Reywat Series

Elevation: 5,000 to 6,000 feet

Precipitation: About 12 inches

Air temperature: About 45 degrees

Frost-free season: About 80 days

Surface rock fragments: 30 percent stones and boulders;

 10 percent cobbles; 20 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Rubble land Miscellaneous Area

Elevation: 5,000 to 6,000 feet

Surface layer texture: Fragmental material

Drainage class: Excessively drained

Dominant Present Vegetation

Old Camp: Thurber needlegrass, Wyoming big sagebrush

Reywat: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Rubble land: None

Inclusion 1: Indian ricegrass, Wyoming big sagebrush, basin wildrye, bottlebrush squirreltail, erigonum

Inclusion 2: Sandberg bluegrass, Thurber needlegrass, bluebunch wheatgrass, sagebrush

Inclusion 3: Basin big sagebrush, basin wildrye, rubber rabbitbrush

Inclusion 4: Baltic rush, Nevada bluegrass, meadow barley

Ecological Site

Old Camp: 023XY006NV

Reywat: 023XY039NV

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: north

Inclusion 4--Landform: Alluvial fans; geomorphic position: toeslope

Major Component Description**Jaybee Series***Elevation:* 4,800 to 5,200 feet*Precipitation:* About 9 inches*Air temperature:* About 47 degrees*Frost-free season:* About 90 days*Surface rock fragments:* 2 percent stones and boulders; 25 percent cobbles; 20 percent gravel*Surface layer texture:* Very cobbly loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from volcanic rocks**Verdico Series***Elevation:* 4,800 to 5,200 feet*Precipitation:* About 9 inches*Air temperature:* About 47 degrees*Frost-free season:* About 90 days*Surface rock fragments:* 10 percent stones and boulders; 10 percent cobbles; 20 percent gravel*Surface layer texture:* Very stony sandy loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Dominant Present Vegetation**

Jaybee: Thurber needlegrass, sagebrush

Verdico: Thurber needlegrass, bluebunch wheatgrass, sagebrush

Inclusion 1: Basin big sagebrush, basin wildrye

Inclusion 2: Big sagebrush, bluebunch wheatgrass

Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 4: Thurber needlegrass, big sagebrush

Ecological Site

Jaybee: 023XY047NV

Verdico: 023XY047NV

Inclusion 1: 023XY009NV

Inclusion 2: 023XY020NV

Inclusion 3: 023XY017NV

Inclusion 4: 023XY006NV

1095--Corral-Mahala association**Composition****Major Components**

Corral very stony loam, 15 to 50 percent slopes--50 percent

Mahala very cobbly silt loam, 0 to 8 percent slopes--35 percent

Contrasting Inclusions

- Inclusion 1: Davey gravelly loamy sand, 2 to 8 percent slopes--5 percent
 Inclusion 2: Hart Camp stony loam, 15 to 30 percent slopes--5 percent
 Inclusion 3: Vitritorrandic Haploxerolls, Ashy, mesic loam, 2 to 4 percent slopes--5 percent

Map Unit Setting

- Landscape position:* Plateaus and hills
Corral--Landform: Hills; *geomorphic position:* backslope; *aspect:* south
Mahala--Landform: Plateaus; *geomorphic position:* summit
Inclusion 1--Landform: Inset fans
Inclusion 2--Landform: Hills; *geomorphic position:* backslope; *aspect:* north
Inclusion 3--Landform: Inset fans

Major Component Description**Corral Series**

- Elevation:* 5,000 to 5,300 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 15 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Mahala Series

- Elevation:* 5,000 to 5,300 feet
Precipitation: About 12 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent cobbles; 20 percent gravel
Surface layer texture: Very cobbly silt loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

- Corral:* Thurber needlegrass, big sagebrush
Mahala: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
Inclusion 1: Basin big sagebrush, needleandthread
Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
Inclusion 3: Basin wildrye, big sagebrush

Ecological Site

- Corral:* 023XY006NV
Mahala: 023XY031NV
Inclusion 1: 023XY051NV
Inclusion 2: 023XY015NV
Inclusion 3: 023XY009NV

1105--Freznik very stony loam, 2 to 15 percent slopes**Composition****Major Components**

- Freznik very stony loam, 2 to 15 percent slopes--85 percent

Contrasting Inclusions

- Inclusion 1:* Ferver very cobbly silt loam, 2 to 15 percent slopes--8 percent
Inclusion 2: Tunnison very cobbly clay, 0 to 8 percent slopes--7 percent

Map Unit Setting

- Landscape position:* Plateaus
Freznik--Landform: Plateaus
Inclusion 1--Landform: Plateaus; *geomorphic position:* toeslope
Inclusion 2--Landform: Plateaus; *geomorphic position:* backslope; *shape of slope:* concave

Major Component Description**Freznik Series**

- Elevation:* 5,400 to 5,800 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 15 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

- Freznik:* Bluegrass, low sagebrush
Inclusion 1: Thurber needlegrass, bluegrass, low sagebrush
Inclusion 2: Rabbitbrush

Ecological Site

- Freznik:* 023XY021NV
Inclusion 1: 023XY059NV
Inclusion 2: 023XY001NV

1110--Indian Creek-Buffaran association**Composition****Major Components**

- Indian Creek very cobbly loam, 4 to 15 percent slopes--50 percent
 Buffaran very stony loam, 4 to 15 percent slopes--40 percent

Contrasting Inclusions

- Inclusion 1:* Corral stony loam, 4 to 15 percent slopes--4 percent
Inclusion 2: Devada very stony loam, 2 to 15 percent

slopes--4 percent
Inclusion 3: Schamp very stony loam, 2 to 8 percent
slopes--2 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
Indian Creek--Landform: Alluvial fans; shape of slope: concave
Buffaran--Landform: Alluvial fans; shape of slope: convex
Inclusion 1--Landform: Pediments
Inclusion 2--Landform: Plateaus; position on slope: upper
Inclusion 3--Landform: Fan remnants; geomorphic position: toeslope

Major Component Description

Indian Creek Series

Elevation: 5,400 to 5,800 feet
Precipitation: About 11 inches
Air temperature: About 48 degrees
Frost-free season: About 90 days
Surface rock fragments: 20 percent cobbles; 15 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Buffaran Series

Elevation: 5,400 to 5,800 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 10 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Indian Creek: Thurber needlegrass, bluegrass, low sagebrush
Buffaran: Thurber needlegrass, Wyoming big sagebrush, bluegrass
Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bluegrass
Inclusion 2: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, bluegrass

Ecological Site

Indian Creek: 023XY059NV
Buffaran: 023XY006NV
Inclusion 1: 023XY006NV
Inclusion 2: 023XY031NV
Inclusion 3: 023XY006NV

1115--Lofftus-Mesman complex, 0 to 2 percent slopes

Composition

Major Components

Lofftus silt loam, 0 to 1 percent slopes--45 percent
Mesman fine sandy loam, 0 to 2 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--6 percent
Inclusion 2: Langston very gravelly sandy loam, 2 to 4 percent slopes--4 percent
Inclusion 3: Emagert loam, 0 to 2 percent slopes--3 percent
Inclusion 4: Wetvit loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Bolsons
Lofftus--Landform: Lake terraces
Mesman--Landform: Lake terraces; shape of slope: concave
Inclusion 1--Landform: Lagoons
Inclusion 2--Landform: Longshore bars (relict)
Inclusion 3--Landform: Stream terraces
Inclusion 4--Landform: Flood plains

Major Component Description

Lofftus Series

Elevation: 4,560 to 4,580 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface layer texture: Silt loam
Drainage class: Somewhat poorly drained
Dominant parent material: Alluvium derived from lacustrine sediments

Mesman Series

Elevation: 4,560 to 4,580 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Lofftus: Basin wildrye, black greasewood, inland saltgrass
Mesman: Basin wildrye, big sagebrush, black greasewood
Inclusion 1: Thurber needlegrass, basin big sagebrush, basin wildrye
Inclusion 2: Thurber needlegrass, big sagebrush
Inclusion 3: Basin big sagebrush, basin wildrye, rubber rabbitbrush
Inclusion 4: Nevada bluegrass, creeping wildrye, sedge

Ecological Site

Lofftus: 023XY010NV
 Mesman: 024XY022NV
 Inclusion 1: 023XY082NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY009NV
 Inclusion 4: 023XY089NV

1120--McConnel very stony sandy loam, 2 to 8 percent slopes**Composition****Major Components**

McConnel very stony sandy loam, 2 to 8 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Mazuma fine sandy loam, 0 to 2 percent slopes--9 percent
 Inclusion 2: Xeric Torriorthents, sandy-skeletal, mixed, mesic very gravelly sandy loam, 0 to 2 percent slopes--6 percent

Map Unit Setting

Landscape position: Fan piedmonts
 McConnel--Landform: Fan aprons
 Inclusion 1--Landform: Lake plains
 Inclusion 2--Landform: Inset fans

Major Component Description**McConnel Series**

Elevation: 4,200 to 5,000 feet
 Precipitation: About 9 inches
 Air temperature: About 49 degrees
 Frost-free season: About 100 days
 Surface rock fragments: 10 percent stones and boulders; 20 percent gravel
 Surface layer texture: Very stony sandy loam
 Drainage class: Somewhat excessively drained
 Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Dominant Present Vegetation

McConnel: Thurber needlegrass, Wyoming big sagebrush, spiny hopsage
 Inclusion 1: Bud sagebrush, shadscale
 Inclusion 2: Basin big sagebrush, basin wildrye, spiny hopsage

Ecological Site

McConnel: 024XY020NV
 Inclusion 1: 024XY065NV
 Inclusion 2: 024XY041NV

1121--McConnel gravelly fine sandy loam, 2 to 8 percent slopes**Composition****Major Components**

McConnel gravelly fine sandy loam, 0 to 2 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Mazuma fine sandy loam, 2 to 8 percent slopes--7 percent
 Inclusion 2: Schamp stony loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: McConnel very gravelly sandy loam, 0 to 2 percent slopes--3 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 McConnel--Landform: Beach terraces; position on slope: upper
 Inclusion 1--Landform: Lake terraces; position on slope: lower
 Inclusion 2--Landform: Hills; geomorphic position: toeslope
 Inclusion 3--Landform: Drainageways

Major Component Description**McConnel Series**

Elevation: 4,600 to 4,800 feet
 Precipitation: About 9 inches
 Air temperature: About 49 degrees
 Frost-free season: About 100 days
 Surface rock fragments: 20 percent gravel
 Surface layer texture: Gravelly fine sandy loam
 Drainage class: Somewhat excessively drained
 Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Dominant Present Vegetation

McConnel: Wyoming big sagebrush, shadscale, spiny hopsage
 Inclusion 1: Bud sagebrush, shadscale
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

McConnel: 024XY020NV
 Inclusion 1: 024XY065NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY005NV

1125--Halvert-Jaybee-Tunnison association**Composition****Major Components**

Halvert gravelly loam, 0 to 8 percent slopes--40

percent
 Jaybee very cobbly loam, 2 to 8 percent slopes--30 percent
 Tunnison cobbly clay, 0 to 4 percent slopes--15 percent
Contrasting Inclusions
 Inclusion 1: Schamp clay loam, 0 to 2 percent slopes--6 percent
 Inclusion 2: Bucklake very gravelly loam, 2 to 8 percent slopes--6 percent
 Inclusion 3: Fiddler very stony loam, 4 to 15 percent slopes--2 percent
 Inclusion 4: Boulder Lake silty clay, 0 to 2 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus
Halvert--Landform: Plateaus; *geomorphic position:* toeslope
Jaybee--Landform: Plateaus; *geomorphic position:* summit
Tunnison--Landform: Plateaus; *geomorphic position:* toeslope; *shape of slope:* concave
Inclusion 1--Landform: Inset fans
Inclusion 2--Landform: Plateaus; *geomorphic position:* backslope
Inclusion 3--Landform: Plateaus; *geomorphic position:* shoulder
Inclusion 4--Landform: Depressions

Major Component Description

Halvert Series

Elevation: 5,250 to 5,500 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 15 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium and colluvium derived from volcanic rocks

Jaybee Series

Elevation: 5,250 to 5,500 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 2 percent stones and boulders; 25 percent cobbles; 20 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Tunnison Series

Elevation: 5,250 to 5,500 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 15 percent cobbles; 10 percent gravel
Surface layer texture: Cobbly clay

Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Halvert: Bluebunch wheatgrass, sagebrush
Jaybee: Thurber needlegrass, sagebrush
Tunnison: Low sagebrush, rubber rabbitbrush
Inclusion 1: Big sagebrush, Thurber needlegrass
Inclusion 2: Big sagebrush, bluebunch wheatgrass
Inclusion 3: Bluebunch wheatgrass, western juniper
Inclusion 4: Nevada bluegrass, silver sagebrush

Ecological Site

Halvert: 023XY037NV
Jaybee: 023XY047NV
Tunnison: 023XY001NV
Inclusion 1: 023XY006NV
Inclusion 2: 023XY020NV
Inclusion 3: 023XY024NV
Inclusion 4: 023XY003NV

1130--Soughe-Rock outcrop complex, 4 to 30 percent slopes

Composition

Major Components

Soughe very cobbly loam, 4 to 30 percent slopes--75 percent
Rock outcrop--15 percent
Contrasting Inclusions
Inclusion 1: Bucklake very cobbly loam, 15 to 30 percent slopes--7 percent
Inclusion 2: Old Camp very cobbly loam, 15 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
Soughe--Landform: Plateaus; *geomorphic position:* summit
Rock outcrop--Landform: Plateaus
Inclusion 1--Landform: Plateaus; *aspect:* north
Inclusion 2--Landform: Plateaus; *aspect:* south

Major Component Description

Soughe Series

Elevation: 5,000 to 6,000 feet
Precipitation: About 9 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 20 percent cobbles; 25 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Rock outcrop Miscellaneous Area

Elevation: 5,000 to 6,000 feet
Drainage class: Excessively drained

Dominant Present Vegetation

Soughe: Thurber needlegrass, Wyoming big sagebrush, spiny hopsage
 Rock outcrop: None
 Inclusion 1: Big sagebrush, bluebunch wheatgrass
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Soughe: 023XY006NV
 Rock outcrop: none
 Inclusion 1: 023XY039NV
 Inclusion 2: 023XY006NV

1131--Soughe-Rock outcrop complex, 30 to 50 percent slopes**Composition****Major Components**

Soughe very cobbly loam, 30 to 50 percent slopes--60 percent
 Rock outcrop--25 percent

Contrasting Inclusions

Inclusion 1: Uhaldi very cobbly sandy loam, 30 to 50 percent slopes--7 percent
 Inclusion 2: Chime gravelly loam, 4 to 15 percent slopes--6 percent
 Inclusion 3: Pachic Haploxerolls, loamy-skeletal, mixed, mesic gravelly loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Soughe--Landform: Ash flows; geomorphic position: summit
 Rock outcrop--Landform: Hills
 Inclusion 1--Landform: Hills; geomorphic position: backslope; aspect: north
 Inclusion 2--Landform: Pediments
 Inclusion 3--Landform: Alluvial fans

Major Component Description**Soughe Series**

Elevation: 4,800 to 5,200 feet
 Precipitation: About 9 inches
 Air temperature: About 47 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 1 percent stones and boulders; 30 percent cobbles; 20 percent gravel
 Surface layer texture: Very cobbly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Rock outcrop Miscellaneous Area

Elevation: 4,800 to 5,200 feet
 Drainage class: Excessively drained

Dominant Present Vegetation

Soughe: Thurber needlegrass, Wyoming big sagebrush
 Rock outcrop: None
 Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Wyoming big sagebrush, spiny hopsage
 Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

Soughe: 023XY006NV
 Rock outcrop: none
 Inclusion 1: 023XY020NV
 Inclusion 2: 024XY020NV
 Inclusion 3: 023XY009NV

1135--McWatt-Old Camp association**Composition****Major Components**

McWatt extremely stony fine sandy loam, 8 to 30 percent slopes--50 percent
 Old Camp extremely stony loam, 8 to 30 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Rubble land fragmental material--7 percent
 Inclusion 2: Langston very gravelly sandy loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Aridic Argixerolls, loamy-skeletal, mixed, mesic very stony loam, 15 to 50 percent slopes--2 percent
 Inclusion 4: Fernpoint very cobbly sandy loam, 15 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
 McWatt--Landform: Plateaus
 Old Camp--Landform: Plateaus
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope
 Inclusion 2--Landform: Longshore bars (relict)
 Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north
 Inclusion 4--Landform: Beach terraces; position on slope: lower; aspect: north

Major Component Description**McWatt Series**

Elevation: 5,500 to 6,000 feet
 Precipitation: About 9 inches
 Air temperature: About 46 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 15 percent stones and boulders; 20 percent cobbles; 30 percent gravel
 Surface layer texture: Extremely stony fine sandy loam
 Drainage class: Somewhat excessively drained
 Dominant parent material: Alluvium derived from volcanic rocks

Old Camp Series

Elevation: 5,500 to 6,000 feet
 Precipitation: About 10 inches
 Air temperature: About 45 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 15 percent stones and boulders; 20 percent cobbles; 20 percent gravel
 Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

McWatt: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail, spiny hopsage

Old Camp: Thurber needlegrass, Wyoming big sagebrush

Inclusion 1: None

Inclusion 2: Thurber needlegrass, big sagebrush, spiny hopsage

Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 4: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

McWatt: 023XY006NV

Old Camp: 023XY006NV

Inclusion 1: none

Inclusion 2: 023XY006NV

Inclusion 3: 023XY020NV

Inclusion 4: 023XY020NV

1140--Valmy very fine sandy loam, 0 to 2 percent slopes

Composition

Major Components

Valmy very fine sandy loam, 0 to 2 percent slopes--95 percent

Contrasting Inclusions

Inclusion 1: Raglan very fine sandy loam, 0 to 2 percent slopes--3 percent

Inclusion 2: Updike silt loam, 0 to 2 percent slopes, rarely flooded--2 percent

Map Unit Setting

Landscape position: Bolsons

Valmy--Landform: Inset fans

Inclusion 1--Landform: Inset fans

Inclusion 2--Landform: Alluvial flats

Major Component Description

Valmy Series

Elevation: 4,900 to 4,950 feet

Precipitation: About 8 inches

Air temperature: About 51 degrees

Frost-free season: About 100 days

Surface layer texture: Very fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Dominant Present Vegetation

Valmy: Basin big sagebrush, basin wildrye, black greasewood

Inclusion 1: Black greasewood, shadscale

Inclusion 2: Basin wildrye, black greasewood

Ecological Site

Valmy: 024XY006NV

Inclusion 1: 024XY003NV

Inclusion 2: 024XY008NV

1141--Valmy-Langston-Paypoint association

Composition

Major Components

Valmy fine sandy loam, 2 to 8 percent slopes--50 percent

Langston gravelly sandy loam, 2 to 8 percent slopes--20 percent

Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Dugway fine sandy loam, 0 to 2 percent slopes--7 percent

Inclusion 2: Saraph gravelly sandy loam, 2 to 4 percent slopes--5 percent

Inclusion 3: Mesman fine sandy loam, 0 to 2 percent slopes--3 percent

Map Unit Setting

Landscape position: Intermontane basins

Valmy--Landform: Beach terraces

Langston--Landform: Longshore bars (relict)

Paypoint--Landform: Lagoons

Inclusion 1--Landform: Lake terraces

Inclusion 2--Landform: Pediments; geomorphic position: shoulder; shape of slope: convex

Inclusion 3--Landform: Lake terraces

Major Component Description

Valmy Series

Elevation: 4,600 to 4,800 feet

Precipitation: About 8 inches

Air temperature: About 51 degrees

Frost-free season: About 100 days

Surface layer texture: Fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Langston Series

Elevation: 4,600 to 4,800 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 90 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks over lacustrine sediments

Paypoint Series

Elevation: 4,600 to 4,800 feet

Precipitation: About 9 inches

Air temperature: About 47 degrees

Frost-free season: About 90 days

Surface rock fragments: 15 percent gravel

Surface layer texture: Gravelly fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks, loess and volcanic ash

Dominant Present Vegetation

Valmy: Big sagebrush, black greasewood, wheatgrass
Langston: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Paypoint: Basin wildrye, big sagebrush, bottlebrush squirreltail, rubber rabbitbrush

Inclusion 1: Basin wildrye, big sagebrush, rabbitbrush

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, wheatgrass

Inclusion 3: Wyoming big sagebrush, bottlebrush squirreltail

Ecological Site

Valmy: 024XY022NV

Langston: 023XY006NV

Paypoint: 023XY082NV

Inclusion 1: 023XY005NV

Inclusion 2: 023XY006NV

Inclusion 3: 023XY006NV

1145--Wendane silt loam, 0 to 2 percent slopes, rarely flooded

Composition

Major Components

Wendane silt loam, 0 to 2 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Raglan silt loam, 0 to 2 percent slopes--5 percent

Inclusion 2: Isalde fine sand, 4 to 15 percent slopes--5 percent

Inclusion 3: Playas, 0 to 1 percent slopes--5 percent

Map Unit Setting

Landscape position: Bolsons

Wendane--Landform: Alluvial flats

Inclusion 1--Landform: Lake terraces

Inclusion 2--Landform: Dunes

Inclusion 3--Landform: Playas

Major Component Description

Wendane Series

Elevation: 4,000 to 4,200 feet

Precipitation: About 7 inches

Air temperature: About 48 degrees

Frost-free season: About 110 days

Surface layer texture: Silt loam

Drainage class: Somewhat poorly drained

Dominant parent material: Alluvium derived from volcanic rocks, loess and volcanic ash

Dominant Present Vegetation

Wendane: Basin wildrye, black greasewood

Inclusion 1: Black greasewood, bottlebrush squirreltail, shadscale

Inclusion 2: Indian ricegrass, black greasewood

Inclusion 3: None

Ecological Site

Wendane: 024XY011NV

Inclusion 1: 024XY003NV

Inclusion 2: 024XY066NV

Inclusion 3: none

1150--Saraph-Hangrock-Tuffo association

Composition

Major Components

Saraph very gravelly sandy loam, 4 to 30 percent slopes--35 percent

Hangrock very gravelly loam, 2 to 15 percent slopes--30 percent

Tuffo very gravelly sandy loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Vitrixerandic Haplargids, Ashy, mesic sandy loam, 0 to 4 percent slopes--7 percent

Inclusion 2: Fulstone very gravelly sandy loam, 2 to 8 percent slopes--3 percent

Inclusion 3: Xeric Torriorthents, clayey, montmorillonitic (calcareous), mesic, shallow gravelly clay loam, 8 to 30 percent slopes--3 percent

Inclusion 4: Badland, 50 to 75 percent slopes--2 percent

Map Unit Setting

Landscape position: Hills and intermontane basins

Saraph--Landform: Ash flows; geomorphic position: shoulder

Hangrock--Landform: Fan remnants; geomorphic position: summit

Tuffo--Landform: Ash flows; geomorphic position: backslope

Inclusion 1--Landform: Inset fans

Inclusion 2--Landform: Fan remnants; geomorphic position: summit

Inclusion 3--Landform: Pediments; geomorphic position: backslope

Inclusion 4--Landform: Plateaus; geomorphic position: backslope

Major Component Description

Saraph Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 50 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Hangrock Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Tuffo Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 100 days

Surface rock fragments: 35 percent gravel

Surface layer texture: Very gravelly sandy loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Saraph: Thurber needlegrass, Wyoming big sagebrush
Hangrock: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Tuffo: Wyoming big sagebrush, needlegrass, sagebrush

Inclusion 1: Douglas rabbitbrush, basin big sagebrush, basin wildrye, rubber rabbitbrush

Inclusion 2: Thurber needlegrass, bluegrass, sagebrush

Inclusion 3: Thurber needlegrass, sagebrush

Inclusion 4: None

Ecological Site

Saraph: 023XY006NV

Hangrock: 023XY006NV

Tuffo: 023XY088NV

1151--Saraph-Tuffo-Yellowhills association

Composition

Major Components

Saraph loamy sand, 2 to 8 percent slopes--50 percent

Tuffo fine sandy loam, 15 to 30 percent slopes--25 percent

Yellowhills sandy loam, 0 to 2 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Badland, 50 to 75 percent slopes--5 percent

Inclusion 2: Devada very stony loam, 4 to 15 percent slopes--5 percent

Map Unit Setting

Landscape position: Plateaus

Saraph--Landform: Ash flows; geomorphic position: summit

Tuffo--Landform: Ash flows; geomorphic position: backslope

Yellowhills--Landform: Inset fans

Inclusion 1--Landform: Plateaus; geomorphic position: backslope

Inclusion 2--Landform: Plateaus

Major Component Description

Saraph Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 10 percent gravel

Surface layer texture: Loamy sand

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Tuffo Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 100 days

Surface rock fragments: 10 percent gravel

Surface layer texture: Fine sandy loam

Drainage class: Somewhat excessively drained

Dominant parent material: Residuum derived from tuffaceous rocks

Yellowhills Series

Elevation: 5,700 to 6,100 feet

Precipitation: About 11 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface layer texture: Sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Saraph: Thurber needlegrass, Wyoming big sagebrush

Tuffo: Wyoming big sagebrush, needlegrass

Yellowhills: Idaho fescue, Thurber needlegrass, basin big sagebrush

Inclusion 1: None

Inclusion 2: Thurber needlegrass, bluebunch wheatgrass, low sagebrush

Ecological Site

Saraph: 023XY006NV

Tuffo: 023XY020NV

Yellowhills: 023XY071NV

Inclusion 1: none

Inclusion 2: 023XY031NV

1155--Madeline-Ninemile complex, 4 to 15 percent slopes

Composition

Major Components

Madeline stony loam, 4 to 15 percent slopes--45 percent

Ninemile very cobbly loam, 4 to 15 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Devada very cobbly loam, 4 to 30 percent slopes--8 percent

Inclusion 2: Reywat stony loam, 4 to 15 percent slopes--4 percent

Inclusion 3: Uhaldi stony loam, 8 to 15 percent slopes--2 percent

Inclusion 4: Westbutte stony loam, 8 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus

Madeline--Landform: Plateaus; geomorphic position: shoulder; shape of slope: concave

Ninemile--Landform: Plateaus; geomorphic position: summit; shape of slope: convex

Inclusion 1--Landform: Plateaus; geomorphic position: summit; aspect: south

Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: south

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave

Inclusion 4--Landform: Plateaus; geomorphic position: backslope; aspect: north

Major Component Description

Madeline Series

Elevation: 5,900 to 6,200 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 80 days

Surface rock fragments: 1 percent stones and boulders; 20 percent cobbles; 10 percent gravel

Surface layer texture: Stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Ninemile Series

Elevation: 5,900 to 6,200 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 75 days

Surface rock fragments: 20 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Madeline: Antelope bitterbrush, bluebunch wheatgrass, bluegrass, mountain big sagebrush

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 1: Thurber needlegrass, bluebunch wheatgrass, low sagebrush

Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 4: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

1160--Wylo-Bucklake-Rock outcrop association

Composition

Major Components

Wylo very stony loam, 8 to 30 percent slopes--55 percent
Bucklake extremely stony loam, 15 to 50 percent slopes--20 percent

Rock outcrop--15 percent

Contrasting Inclusions

Inclusion 1: Ceejay stony loam, 8 to 30 percent slopes--4 percent

Inclusion 2: Old Camp very stony loam, 30 to 50 percent slopes--4 percent

Inclusion 3: Halvert gravelly loam, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus

Wylo--Landform: Plateaus; geomorphic position: summit

Bucklake--Landform: Plateaus; geomorphic position: backslope

Rock outcrop--Landform: Plateaus

Inclusion 1--Landform: Plateaus; geomorphic position: summit; position on slope: lower

Inclusion 2--Landform: Plateaus; geomorphic position: backslope; position on slope: lower

Inclusion 3--Landform: Plateaus; geomorphic position: summit; shape of slope: concave

Major Component Description

Wylo Series

Elevation: 5,800 to 5,900 feet

Precipitation: About 11 inches

Air temperature: About 45 degrees

Frost-free season: About 80 days

Surface rock fragments: 10 percent stones and boulders; 5 percent cobbles; 25 percent gravel

Surface layer texture: Very stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Bucklake Series

Elevation: 5,800 to 6,000 feet

Precipitation: About 11 inches

Air temperature: About 45 degrees

Frost-free season: About 80 days

Surface rock fragments: 20 percent stones and boulders; 10 percent cobbles; 10 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Rock outcrop Miscellaneous Area

Elevation: 5,800 to 6,000 feet

Drainage class: Excessively drained

Dominant Present Vegetation

Wylo: Bluebunch wheatgrass, sagebrush
 Bucklake: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Rock outcrop: None
 Inclusion 1: Thurber needlegrass, bluegrass, sagebrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Thurber needlegrass, bluebunch wheatgrass, sagebrush

Ecological Site

Wylo: 023XY037NV
 Bucklake: 023XY039NV

Inclusion 4--Landform: Plateaus; geomorphic position: backslope; aspect: north

Major Component Description**Devada Series**

Elevation: 5,800 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 1 percent stones and boulders; 2 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Madeline Series

Elevation: 5,800 to 6,200 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 80 days

Surface layer texture: Very cobbly loam
Surface rock fragments: 20 percent cobbles; 30 percent gravel
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Ninemile Series

Elevation: 5,800 to 6,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 75 days
Surface rock fragments: 20 percent cobbles; 30 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Devada: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Madeline: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 1: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 3: Nevada bluegrass, big sagebrush, sedge
 Inclusion 4: Idaho fescue, mountain big sagebrush, needlegrass, snowberry

Ecological Site

Devada: 023XY031NV
 Madeline: 023XY015NV
 Ninemile: 023XY017NV

 Inclusion 3--Landform: Pediments; geomorphic position: backslope; aspect: north
 Inclusion 4--Landform: Plateaus; geomorphic position: backslope

Major Component Description

Devada Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent cobbles; 20 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Nitpac Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Uhaldi Series

Elevation: 5,600 to 6,000 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 3 percent cobbles; 30 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Devada: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Nitpac: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Uhaldi: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 1: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 3: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
Inclusion 4: Big sagebrush, bluebunch wheatgrass

Ecological Site

Inclusion 2--Landform: Plateaus; geomorphic position: backslope

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north

Major Component Description

Devada Series

Elevation: 5,500 to 6,300 feet

Precipitation: About 12 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 30 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Uhaldi Series

Elevation: 5,500 to 6,300 feet

Precipitation: About 11 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 1 percent stones and boulders; 3 percent cobbles; 30 percent gravel

Surface layer texture: Stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Devada: Thurber needlegrass, bluebunch wheatgrass, low sagebrush

Uhaldi: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 1: Big sagebrush, bluebunch wheatgrass

Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 3: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

1175--Ferver-Tunnison association

Composition

Major Components

Ferver very cobbly silt loam, 2 to 8 percent slopes--65 percent

Tunnison cobbly clay, 0 to 4 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Lithic Xeric Haplargids, loamy, mixed, mesic very stony loam, 2 to 8 percent slopes--7 percent

Inclusion 2: Devada very cobbly loam, 2 to 8 percent slopes--6 percent

Inclusion 3: Boulder Lake silty clay, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus

Ferver--Landform: Plateaus; geomorphic position:

toeslope; shape of slope: concave

Tunnison--Landform: Depressions; shape of slope: concave

Inclusion 1--Landform: Plateaus; geomorphic position: shoulder

Inclusion 2--Landform: Plateaus

Inclusion 3--Landform: Depressions

Major Component Description

Ferver Series

Elevation: 5,200 to 5,500 feet

Precipitation: About 11 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 1 percent stones and boulders; 25 percent cobbles; 20 percent gravel

Surface layer texture: Very cobbly silt loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Tunnison Series

Elevation: 5,200 to 5,500 feet

Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 15 percent cobbles; 10 percent gravel
Surface layer texture: Cobbly clay
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Ferver: Thurber needlegrass, bluegrass, low sagebrush
 Tunnison: Low sagebrush, rubber rabbitbrush
 Inclusion 1: Sandberg bluegrass, low sagebrush
 Inclusion 2: Bluebunch wheatgrass, bluegrass, low sagebrush
 Inclusion 3: Silver sagebrush

Ecological Site

Ferver: 023XY059NV
 Tunnison: 023XY001NV
 Inclusion 1: 023XY021NV
 Inclusion 2: 023XY031NV
 Inclusion 3: 023XY003NV

1180--Ninemile-Karlo association

Composition

Major Components

Ninemile very cobbly loam, 2 to 15 percent slopes--70 percent
 Karlo very cobbly clay, 0 to 8 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Toney very cobbly loam, 2 to 15 percent slopes--7 percent
 Inclusion 2: Madeline very stony loam, 8 to 15 percent slopes--6 percent
 Inclusion 3: Badgercamp very stony loam, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
 Ninemile--Landform: Plateaus; shape of slope: convex
 Karlo--Landform: Plateaus; shape of slope: concave
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope
 Inclusion 3--Landform: Plateaus; geomorphic position: shoulder

Major Component Description

Ninemile Series

Elevation: 6,000 to 6,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 75 days
Surface rock fragments: 20 percent cobbles; 30 percent gravel
Surface layer texture: Very cobbly loam
Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Karlo Series

Elevation: 6,000 to 6,200 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 30 percent cobbles; 20 percent gravel
Surface layer texture: Very cobbly clay
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Karlo: Low sagebrush, rubber rabbitbrush
 Inclusion 1: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Curleaf mountainmahogany, mountain big sagebrush

Ecological Site

Ninemile: 023XY017NV
 Karlo: 023XY001NV
 Inclusion 1: 023XY017NV
 Inclusion 2: 023XY015NV
 Inclusion 3: 023XY026NV

1181--Ninemile-Madeline-Tinpan association

Composition

Major Components

Ninemile very cobbly loam, 2 to 15 percent slopes--35 percent
 Madeline very cobbly loam, 4 to 15 percent slopes--30 percent
 Tinpan extremely cobbly loam, 0 to 8 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Karlo very cobbly clay, 0 to 4 percent slopes--9 percent
 Inclusion 2: Newlands stony loam, 8 to 30 percent slopes--3 percent
 Inclusion 3: Crocan extremely stony loam, 2 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
 Ninemile--Landform: Plateaus; geomorphic position: summit; shape of slope: convex
 Madeline--Landform: Plateaus; geomorphic position: backslope
 Tinpan--Landform: Plateaus; shape of slope: concave
 Inclusion 1--Landform: Depressions
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave; aspect: north

Inclusion 3--Landform: Plateaus; geomorphic position: shoulder

Major Component Description

Ninemile Series

Elevation: 6,000 to 7,000 feet
 Precipitation: About 14 inches
 Air temperature: About 44 degrees
 Frost-free season: About 75 days
 Surface rock fragments: 20 percent cobbles; 30 percent gravel
 Surface layer texture: Very cobbly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Madeline Series

Elevation: 6,000 to 7,000 feet
 Precipitation: About 13 inches
 Air temperature: About 44 degrees
 Frost-free season: About 80 days
 Surface rock fragments: 20 percent cobbles; 30 percent gravel
 Surface layer texture: Very cobbly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Tinpan Series

Elevation: 6,000 to 7,000 feet
 Precipitation: About 14 inches
 Air temperature: About 43 degrees
 Frost-free season: About 70 days
 Surface rock fragments: 40 percent cobbles; 20 percent gravel
 Surface layer texture: Extremely cobbly loam
 Drainage class: Well drained
 Dominant parent material: Alluvium and colluvium derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Madeline: Antelope bitterbrush, bluebunch wheatgrass, bluegrass, mountain big sagebrush
 Tinpan: Idaho fescue, bluebunch wheatgrass, bluegrass, low sagebrush
 Inclusion 1: Low sagebrush, rubber rabbitbrush
 Inclusion 2: Idaho fescue, mountain big sagebrush, needlegrass
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush, western juniper

Ecological Site

Ninemile: 023XY017NV

 Inclusion 3: 023XY095NV

1182--Ninemile-Westbutte complex, 2 to 15 percent slopes

Composition

Major Components

Ninemile very cobbly loam, 2 to 15 percent slopes--60 percent
 Westbutte stony loam, 2 to 15 percent slopes--30 percent
Contrasting Inclusions
 Inclusion 1: Devada very stony loam, 4 to 30 percent slopes--8 percent
 Inclusion 2: Vitritorrandic Haploxerolls, Ashy, frigid gravelly loamy sand, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
 Ninemile--Landform: Plateaus; geomorphic position: summit
 Westbutte--Landform: Plateaus; geomorphic position: backslope
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: south
 Inclusion 2--Landform: Inset fans

Major Component Description

Ninemile Series

Elevation: 6,000 to 6,400 feet
 Precipitation: About 14 inches
 Air temperature: About 44 degrees
 Frost-free season: About 75 days
 Surface rock fragments: 20 percent cobbles; 30 percent gravel
 Surface layer texture: Very cobbly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from volcanic rocks

Westbutte Series

Elevation: 6,000 to 6,400 feet
 Precipitation: About 12 inches
 Air temperature: About 45 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 5 percent stones and boulders; 10 percent cobbles; 20 percent gravel
 Surface layer texture: Stony loam
 Drainage class: Well drained
 Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Westbutte: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Bluebunch wheatgrass, low sagebrush
 Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Major Component Description

Ninemile Series

Elevation: 6,000 to 6,800 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 75 days

Surface rock fragments: 5 percent stones and boulders; 20 percent cobbles; 15 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Tinpan Series

Elevation: 6,000 to 6,800 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 70 days

Surface rock fragments: 40 percent cobbles; 20 percent gravel

Surface layer texture: Extremely cobbly loam

Drainage class: Well drained

Dominant parent material: Alluvium and colluvium derived from volcanic rocks

Crocán Series

Elevation: 6,000 to 6,800 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 70 days

Surface rock fragments: 10 percent stones and boulders; 15 percent cobbles; 20 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush

Tinpan: Idaho fescue, bluebunch wheatgrass, bluegrass, low sagebrush

Crocán: Cusick bluegrass, Idaho fescue, bluebunch wheatgrass, low sagebrush, western juniper

Inclusion 1: Thurber needlegrass, bluebunch wheatgrass, low sagebrush

Inclusion 2: Bluegrass, low sagebrush, rubber rabbitbrush

Inclusion 3: Idaho fescue, bluegrass, low sagebrush

Inclusion 4: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

1187--Ninemile-Tinpan-Hart Camp association

Composition

Major Components

Ninemile very stony loam, 4 to 30 percent slopes--40 percent

Tinpan extremely cobbly loam, 0 to 8 percent slopes--30 percent

Hart Camp stony loam, 4 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Argixerolls, clayey, montmorillonitic, frigid extremely stony loam, 2 to 15 percent slopes--8 percent

Inclusion 2: Devada very cobbly loam, 4 to 30 percent slopes--5 percent

Inclusion 3: Ashtre stony loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus

Ninemile--Landform: Plateaus; geomorphic position: summit

Tinpan--Landform: Plateaus; shape of slope: concave

Hart Camp--Landform: Plateaus; geomorphic position: shoulder

Inclusion 1--Landform: Plateaus; geomorphic position: shoulder

Inclusion 2--Landform: Plateaus; geomorphic position: summit; aspect: south

Inclusion 3--Landform: Ash flows

Major Component Description

Ninemile Series

Elevation: 5,900 to 6,500 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 75 days

Surface rock fragments: 5 percent stones and boulders; 20 percent cobbles; 15 percent gravel

Surface layer texture: Very stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Tinpan Series*Elevation:* 5,900 to 6,500 feet*Precipitation:* About 14 inches*Air temperature:* About 43 degrees*Frost-free season:* About 70 days*Surface rock fragments:* 40 percent cobbles; 20 percent gravel*Surface layer texture:* Extremely cobbly loam*Drainage class:* Well drained*Dominant parent material:* Alluvium and colluvium derived from volcanic rocks**Hart Camp Series***Elevation:* 5,900 to 6,500 feet*Precipitation:* About 11 inches*Air temperature:* About 43 degrees*Frost-free season:* About 70 days*Surface layer texture:* Stony loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Dominant Present Vegetation**

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush

Tinpan: Idaho fescue, bluebunch wheatgrass, bluegrass, low sagebrush

Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 1: Idaho fescue, bluegrass, low sagebrush

Inclusion 2: Thurber needlegrass, bluebunch wheatgrass, bluegrass, low sagebrush

Inclusion 3: Idaho fescue, mountain big sagebrush, needlegrass

Major Component Description

Ninemile Series

Elevation: 6,200 to 6,800 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 75 days

Surface rock fragments: 20 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Badgercamp Series

Elevation: 6,200 to 6,800 feet

Precipitation: About 16 inches

Air temperature: About 40 degrees

Frost-free season: About 50 days

Surface rock fragments: 2 percent stones and boulders; 2 percent cobbles; 10 percent gravel

Surface layer texture: Bouldery loam

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Crocán Series

Elevation: 6,200 to 6,800 feet

Precipitation: About 14 inches

Air temperature: About 43 degrees

Frost-free season: About 70 days

Surface rock fragments: 10 percent stones and boulders; 15 percent cobbles; 20 percent gravel

Surface layer texture: Extremely stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush

Badgercamp: Idaho fescue, big sagebrush, curlleaf mountainmahogany, needlegrass

Crocán: Cusick bluegrass, Idaho fescue, bluebunch wheatgrass, low sagebrush, western juniper

Inclusion 1: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Idaho fescue, mountain big sagebrush, needlegrass, snowberry

Inclusion 3: Quaking aspen

Inclusion 4: Idaho fescue, low sagebrush

Ecological Site

1190--Ferver-Nitpac association

Composition

Major Components

Ferver very gravelly loam, 2 to 15 percent slopes--50 percent

Nitpac very cobbly loam, 2 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Tunnison cobbly clay, 0 to 8 percent slopes--9 percent

Inclusion 2: Devada very stony loam, 2 to 15 percent slopes--3 percent

Inclusion 3: Boulder Lake silty clay, 0 to 2 percent slopes--2 percent

Inclusion 4: Weimer clay, 0 to 2 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus

Ferver--Landform: Plateaus; geomorphic position: toeslope; shape of slope: concave

Nitpac--Landform: Plateaus; geomorphic position: backslope

Inclusion 1--Landform: Depressions; geomorphic position: summit; shape of slope: concave

Inclusion 2--Landform: Plateaus

Inclusion 3--Landform: Depressions

Inclusion 4--Landform: Depressions

Major Component Description

Ferver Series

Elevation: 5,300 to 5,600 feet

Precipitation: About 11 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 1 percent cobbles; 45 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Nitpac Series

Elevation: 5,300 to 5,600 feet

Precipitation: About 11 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 1 percent stones and boulders; 15 percent cobbles; 20 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Ferver: Thurber needlegrass, bluegrass, low sagebrush

Nitpac: Bluebunch wheatgrass, low sagebrush

Inclusion 1: Bluegrass, rubber rabbitbrush

Inclusion 2: Thurber needlegrass, bluebunch wheatgrass, low sagebrush

Inclusion 3: Bluegrass, silver sagebrush

Inclusion 4: Sedge, silver sagebrush

Ecological Site

Ferver: 023XY059NV

Nitpac: 023XY031NV

1195--Bitner-Ashcamp association

Composition

Major Components

Bitner gravelly sandy loam, 4 to 30 percent slopes--50 percent

Ashcamp sandy loam, 2 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Reywat stony loam, 15 to 50 percent slopes--6 percent

Inclusion 2: Frentera gravelly sandy loam, 15 to 30 percent slopes--5 percent

Inclusion 3: Powlow very gravelly loam, 2 to 15 percent slopes--4 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons

Bitner--Landform: Plateaus; geomorphic position: shoulder

Ashcamp--Landform: Plateaus; geomorphic position: summit

Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: south

Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: north

Inclusion 3--Landform: Fan remnants

Major Component Description

Bitner Series

Elevation: 5,600 to 6,200 feet

Precipitation: About 12 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 15 percent gravel

Surface layer texture: Gravelly sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Ashcamp Series

Elevation: 5,600 to 6,200 feet

Precipitation: About 13 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface layer texture: Sandy loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Bitner: Idaho fescue, Thurber needlegrass, big sagebrush, bluebunch wheatgrass, bluegrass

Ashcamp: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 1: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Inclusion 2: Idaho fescue, Thurber needlegrass, big sagebrush

Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Bitner: 023XY096NV
 Ashcamp: 023XY020NV

1205--Davey loamy fine sand, 2 to 15 percent slopes**Composition****Major Components**

Davey loamy fine sand, 2 to 15 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Paypoint gravelly fine sandy loam, 0 to 2 percent slopes--7 percent
 Inclusion 2: Zorravista fine sand, 4 to 15 percent slopes--5 percent
 Inclusion 3: Bombadil very stony loam, cool, 8 to 15 percent slopes--3 percent

Map Unit Setting

Landscape position: Intermontane basins
Davey--Landform: Beach terraces
Inclusion 1--Landform: Lagoons
Inclusion 2--Landform: Dunes
Inclusion 3--Landform: Plateaus; geomorphic position: summit

Major Component Description**Davey Series**

Elevation: 5,500 to 5,700 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface layer texture: Loamy fine sand
Drainage class: Somewhat excessively drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Davey: Indian ricegrass, basin big sagebrush, needleandthread
 Inclusion 1: Basin wildrye, big sagebrush
 Inclusion 2: Indian ricegrass, basin big sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Ecological Site

Davey: 023XY051NV
 Inclusion 1: 023XY082NV
 Inclusion 2: 023XY011NV
 Inclusion 3: 023XY006NV

1206--Davey-Corral association**Composition****Major Components**

Davey loamy fine sand, 2 to 15 percent slopes--50 percent

Corral loamy fine sand, 2 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Langston very gravelly loamy fine sand, 2 to 15 percent slopes--5 percent
 Inclusion 2: Zorravista fine sand, 2 to 15 percent slopes--5 percent
 Inclusion 3: Saraph gravelly loamy sand, 2 to 15 percent slopes--3 percent
 Inclusion 4: Paypoint gravelly sandy loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Intermontane basins
Davey--Landform: Beach terraces
Corral--Landform: Pediments
Inclusion 1--Landform: Longshore bars (relict)
Inclusion 2--Landform: Dunes
Inclusion 3--Landform: Pediments; geomorphic position: summit; shape of slope: convex
Inclusion 4--Landform: Lagoons

Major Component Description**Davey Series**

Elevation: 5,550 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface layer texture: Loamy fine sand
Drainage class: Somewhat excessively drained
Dominant parent material: Alluvium derived from mixed rocks

Corral Series

Elevation: 5,500 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface layer texture: Loamy fine sand
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Davey: Indian ricegrass, basin big sagebrush, needleandthread
 Corral: Indian ricegrass, basin big sagebrush, needleandthread
 Inclusion 1: Indian ricegrass, basin big sagebrush, needleandthread
 Inclusion 2: Basin big sagebrush, needleandthread
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, needlegrass
 Inclusion 4: Douglas rabbitbrush, basin wildrye, big sagebrush, bottlebrush squirreltail, rubber rabbitbrush

Ecological Site

Davey: 023XY051NV
 Corral: 023XY051NV

 Inclusion 4: 023XY082NV

1210--Mazuma-Bighat association**Composition****Major Components**

Mazuma fine sandy loam, 2 to 4 percent slopes--50 percent
 Bighat very stony sandy loam, 4 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Mazuma fine sandy loam, alkali, 2 to 8 percent slopes--8 percent
 Inclusion 2: Raglan fine sandy loam, 0 to 4 percent slopes--7 percent

Map Unit Setting

Landscape position: Bolsons
 Mazuma--Landform: Lake terraces
 Bighat--Landform: Beach terraces
 Inclusion 1--Landform: Inset fans
 Inclusion 2--Landform: Lake terraces; position on slope: lower

Major Component Description**Mazuma Series**

Elevation: 4,500 to 4,700 feet
Precipitation: About 6 inches
Air temperature: About 50 degrees
Frost-free season: About 100 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Bighat Series

Elevation: 4,500 to 4,700 feet
Precipitation: About 6 inches
Air temperature: About 47 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent stones and boulders; 20 percent cobbles; 15 percent gravel
Surface layer texture: Very stony sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Mazuma: Bud sagebrush, shadscale
 Bighat: Bud sagebrush, shadscale
 Inclusion 1: Black greasewood, shadscale
 Inclusion 2: Black greasewood, shadscale

Ecological Site

Mazuma: 024XY065NV
 Bighat: 024XY002NV
 Inclusion 1: 024XY003NV
 Inclusion 2: 024XY003NV

1215--Raglan-Isolde association**Composition****Major Components**

Raglan very fine sandy loam, 0 to 2 percent slopes--50 percent
 Isolde fine sand, 2 to 15 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Mazuma silt loam, 0 to 2 percent slopes, dry--6 percent
 Inclusion 2: Xeric Haplocambids, coarse-loamy, mixed, mesic fine sandy loam, 0 to 2 percent slopes--5 percent
 Inclusion 3: Haploduridic Xeric Torriorthents, coarse-loamy, mixed (calcareous), mesic fine sandy loam, 0 to 2 percent slopes--4 percent

Map Unit Setting

Landscape position: Bolsons
 Raglan--Landform: Lake terraces
 Isolde--Landform: Dunes
 Inclusion 1--Landform: Lake terraces
 Inclusion 2--Landform: Drainageways
 Inclusion 3--Landform: Inset fans

Major Component Description**Raglan Series**

Elevation: 4,500 to 4,600 feet
Precipitation: About 6 inches
Air temperature: About 50 degrees
Frost-free season: About 100 days
Surface layer texture: Very fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Isolde Series

Elevation: 4,500 to 4,600 feet
Precipitation: About 6 inches
Air temperature: About 50 degrees
Frost-free season: About 100 days
Surface layer texture: Fine sand
Drainage class: Excessively drained
Dominant parent material: Eolian material

Dominant Present Vegetation

Raglan: Black greasewood, bud sagebrush, shadscale
 Isolde: Indian ricegrass, black greasewood, spiny hopsage
 Inclusion 1: Bottlebrush squirreltail, shadscale
 Inclusion 2: Wyoming big sagebrush, spiny hopsage
 Inclusion 3: Basin wildrye, big sagebrush, black greasewood, western wheatgrass

Ecological Site

Inclusion 1--Landform: Hills; geomorphic position: toeslope
Inclusion 2--Landform: Plateaus; geomorphic position: backslope
Inclusion 3--Landform: Fan skirts

Major Component Description**Chime Series***Elevation:* 4,700 to 4,900 feet*Precipitation:* About 9 inches*Air temperature:* About 47 degrees*Frost-free season:* About 100 days*Surface rock fragments:* 20 percent gravel*Surface layer texture:* Gravelly loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Dominant Present Vegetation**

Chime: Wyoming big sagebrush, spiny hopsage

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush

Inclusion 2: Bud sagebrush, shadscale

Inclusion 3: Basin big sagebrush, basin wildrye

Ecological Site

Chime: 024XY020NV

Inclusion 1: 023XY006NV

Inclusion 2: 024XY025NV

Inclusion 3: 023XY005NV

1240--Toney-Millerlux-Hart Camp association**Composition****Major Components**

Toney extremely cobbly loam, 2 to 8 percent slopes--40 percent

Millerlux very cobbly loam, 2 to 15 percent slopes--30 percent

Hart Camp stony loam, 4 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Ninemile very stony loam, 2 to 8 percent slopes--8 percent

Inclusion 2: Karlo very cobbly clay, 0 to 4 percent slopes--6 percent

Inclusion 3: Hapgood stony loam, 8 to 15 percent slopes--1 percent

Map Unit Setting*Landscape position:* Plateaus and hills

Toney--Landform: Hills; geomorphic position: backslope; shape of slope: concave

Millerlux--Landform: Hills; geomorphic position: summit; shape of slope: convex

Hart Camp--Landform: Hills; geomorphic position: toeslope; position on slope: lower

Inclusion 1--Landform: Plateaus

Inclusion 2--Landform: Depressions; shape of slope: concave

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north

Major Component Description**Toney Series***Elevation:* 6,000 to 6,300 feet*Precipitation:* About 13 inches*Air temperature:* About 42 degrees*Frost-free season:* About 60 days*Surface rock fragments:* 10 percent stones and boulders; 30 percent cobbles; 25 percent gravel*Surface layer texture:* Extremely cobbly loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Millerlux Series***Elevation:* 6,000 to 6,300 feet*Precipitation:* About 12 inches*Air temperature:* About 43 degrees*Frost-free season:* About 60 days*Surface rock fragments:* 25 percent cobbles; 20 percent gravel*Surface layer texture:* Very cobbly loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Hart Camp Series***Elevation:* 6,000 to 6,300 feet*Precipitation:* About 11 inches*Air temperature:* About 43 degrees*Frost-free season:* About 70 days*Surface rock fragments:* 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel*Surface layer texture:* Stony loam*Drainage class:* Well drained*Dominant parent material:* Residuum derived from tuffaceous rocks**Dominant Present Vegetation**

Toney: Idaho fescue, bluebunch wheatgrass, low sagebrush

Millerlux: Sandberg bluegrass, low sagebrush

Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 1: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 2: Low sagebrush, rubber rabbitbrush

Inclusion 3: Idaho fescue, mountain big sagebrush, needlegrass

1245--Saraph-Uhaldi-Fretera association**Composition****Major Components**

Saraph very gravelly sandy loam, 4 to 30 percent slopes--45 percent

Uhaldi stony loam, 4 to 30 percent slopes--25 percent

Fretera gravelly sandy loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

- Inclusion 1: Paypoint sandy loam, 0 to 2 percent slopes--7 percent
 Inclusion 2: Old Camp very stony loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Powlow very gravelly loam, 2 to 8 percent slopes--2 percent
 Inclusion 4: Esmod very gravelly fine sandy loam, 2 to 15 percent slopes--1 percent

Map Unit Setting

- Landscape position:* Hills and intermontane basins
Saraph--Landform: Ash flows; geomorphic position: summit; shape of slope: convex
Uhaldi--Landform: Hills; geomorphic position: backslope; shape of slope: concave
Frentera--Landform: Ash flows; geomorphic position: backslope
Inclusion 1--Landform: Lagoons
Inclusion 2--Landform: Plateaus
Inclusion 3--Landform: Fan remnants
Inclusion 4--Landform: Fan remnants; geomorphic position: summit

Major Component Description**Saraph Series**

- Elevation:* 5,600 to 6,100 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Uhaldi Series

- Elevation:* 5,600 to 6,100 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 1 percent stones and boulders; 3 percent cobbles; 30 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Frentera Series

- Elevation:* 5,600 to 6,100 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 30 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

- Saraph: Thurber needlegrass, Wyoming big sagebrush, bluegrass

- Uhaldi: Thurber needlegrass, Wyoming big sagebrush, bluebunch wheatgrass
 Frentera: Idaho fescue, Thurber needlegrass, mountain big sagebrush
 Inclusion 1: Basin big sagebrush, basin wildrye, bluegrass
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, bluegrass
 Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 4: Thurber needlegrass, bluegrass, low sagebrush

Ecological Site

- Saraph: 023XY006NV
 Uhaldi: 023XY020NV
 Frentera: 023XY072NV
 Inclusion 1: 023XY082NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY020NV
 Inclusion 4: 023XY059NV

1250--Ashone-Ashdos-Bearbutte association**Composition****Major Components**

- Ashone very gravelly fine sandy loam, 4 to 30 percent slopes--40 percent
 Ashdos very gravelly fine sandy loam, 4 to 30 percent slopes--35 percent
 Bearbutte fine sandy loam, 4 to 15 percent slopes--10 percent

Contrasting Inclusions

- Inclusion 1: Vitrixerandic Torriorthents, Ashy-skeletal, mesic, shallow very gravelly sandy loam, 2 to 15 percent slopes--10 percent
 Inclusion 2: Welch fine sandy loam, 2 to 8 percent slopes, rarely flooded--3 percent
 Inclusion 3: Rock outcrop--2 percent

Map Unit Setting

- Landscape position:* Mountains and intermontane basins
Ashone--Landform: Ash flows; geomorphic position: backslope; aspect: south
Ashdos--Landform: Ash flows; geomorphic position: backslope; aspect: north
Bearbutte--Landform: Mountains; geomorphic position: backslope; shape of slope: concave
Inclusion 1--Landform: Alluvial fans
Inclusion 2--Landform: Depressions; shape of slope: concave
Inclusion 3--Landform: Mountains

Major Component Description**Ashone Series**

- Elevation:* 5,900 to 6,400 feet
Precipitation: About 14 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 1 percent cobbles; 50 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Ashdos Series

Elevation: 5,900 to 6,400 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 80 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Bearbutte Series

Elevation: 5,900 to 6,400 feet
Precipitation: About 13 inches
Air temperature: About 43 degrees
Frost-free season: About 80 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Ashone: Idaho fescue, Thurber needlegrass, antelope bitterbrush, low sagebrush
 Ashdos: Idaho fescue, Thurber needlegrass, low sagebrush
 Bearbutte: Idaho fescue, Thurber needlegrass, antelope bitterbrush, mountain big sagebrush
 Inclusion 1: Sandberg bluegrass, low sagebrush
 Inclusion 2: Nevada bluegrass, Rocky Mountain iris, big sagebrush
 Inclusion 3: None

Ecological Site

Ashone: 023XY078NV
 Ashdos: 023XY079NV
 Bearbutte: 023XY066NV
 Inclusion 1: 023XY021NV

Major Component Description

Ashdos Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 80 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Ashtre Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Hackwood Series

Elevation: 6,000 to 6,900 feet
Precipitation: About 16 inches
Air temperature: About 41 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 20 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

- Ashdos: Idaho fescue, Thurber needlegrass, low sagebrush
 Ashtre: Idaho fescue, Thurber needlegrass, mountain big sagebrush
 Hackwood: Bluegrass, quaking aspen, snowberry
 Inclusion 1: Idaho fescue, mountain big sagebrush
 Inclusion 2: Idaho fescue, antelope bitterbrush, mountain big sagebrush
 Inclusion 3: Nevada bluegrass, rush
 Inclusion 4: Quaking aspen

Ecological Site

1255--Newlands-Ninemile complex, 4 to 15 percent slopes

Composition

Major Components

- Newlands stony loam, 4 to 15 percent slopes--60 percent
 Ninemile very cobbly loam, 4 to 15 percent slopes--25 percent

Contrasting Inclusions

- Inclusion 1: Lithic Argixerolls, loamy-skeletal, mixed, frigid very gravelly loam, 2 to 15 percent slopes--5 percent
 Inclusion 2: Menbo very gravelly loam, 4 to 15 percent slopes--5 percent

Inclusion 3: Westbutte very gravelly loam, 4 to 30 percent slopes--5 percent

Map Unit Setting

Landscape position: Plateaus

Newlands--Landform: Plateaus; geomorphic position: summit; shape of slope: concave; aspect: north

Ninemile--Landform: Plateaus; geomorphic position: summit

Inclusion 1--Landform: Plateaus; geomorphic position: summit

Inclusion 2--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: southwest

Major Component Description

Newlands Series

Elevation: 6,200 to 6,400 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 60 days

Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 10 percent gravel

Surface layer texture: Stony loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Ninemile Series

Elevation: 6,200 to 6,400 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 75 days

Surface rock fragments: 20 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Newlands: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 1: Idaho fescue, low sagebrush

Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 3--Landform: Plateaus; geomorphic position: summit; position on slope: upper; shape of slope: convex

Inclusion 4--Landform: Pediments; position on slope: lower

Major Component Description

Hartig Series

Elevation: 5,800 to 6,500 feet

Precipitation: About 14 inches

Air temperature: About 42 degrees

Frost-free season: About 50 days

Surface rock fragments: 15 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Hartig: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 1: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 4: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Hartig: 023XY016NV

Inclusion 1: 023XY016NV

Inclusion 2: 023XY007NV

Inclusion 3: 023XY017NV

Inclusion 4: 023XY015NV

1271--Hartig-Newlands association

Composition

Major Components

Hartig very stony sandy loam, 30 to 50 percent slopes--70 percent

Newlands stony loam, 30 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hackwood loam, 15 to 30 percent slopes--6 percent

Inclusion 2: Badgercamp very stony loam, 8 to 30 percent slopes--5 percent

Inclusion 3: Hackwood very gravelly loam, cold, 30 to 50 percent slopes--4 percent

Map Unit Setting

Landscape position: Plateaus

Hartig--Landform: Plateaus; geomorphic position: backslope

Newlands--Landform: Plateaus; geomorphic position: backslope; aspect: north

Inclusion 1--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; shape of slope: concave; aspect: north

Inclusion 2--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; shape of slope: concave; aspect: north

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; position on slope: upper

Major Component Description

Hartig Series

Elevation: 5,800 to 6,300 feet

Precipitation: About 14 inches

Air temperature: About 42 degrees

Frost-free season: About 50 days

Surface rock fragments: 10 percent stones and boulders; 10 percent cobbles; 25 percent gravel

Surface layer texture: Very stony sandy loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Newlands Series

Elevation: 5,800 to 6,300 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 60 days

Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel

Surface layer texture: Stony loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Hartig: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Newlands: Idaho fescue, bluebunch wheatgrass, bluegrass, mountain big sagebrush

Inclusion 1: Quaking aspen
 Inclusion 2: Idaho fescue, curleaf mountainmahogany,
 mountain big sagebrush
 Inclusion 3: Mountain brome, quaking aspen, snowberry

Ecological Site

Hartig: 023XY016NV
 Newlands: 023XY054NV
 Inclusion 1: 023XY028NV
 Inclusion 2: 023XY026NV
 Inclusion 3: 023XY027NV

1272--Hartig-Rock outcrop association

Composition

Major Components

Hartig very gravelly sandy loam, 30 to 50 percent slopes--
 70 percent

Rock outcrop--15 percent

Contrasting Inclusions

Inclusion 1: Hartig very gravelly sandy loam, 50 to 90
 percent slopes--6 percent
 Inclusion 2: Ashdos very gravelly sandy loam, 30 to 50
 percent slopes--5 percent
 Inclusion 3: Reywat very stony loam, 15 to 50 percent
 slopes--3 percent
 Inclusion 4: Corral very stony loam, 30 to 50 percent
 slopes--1 percent

Map Unit Setting

Landscape position: Plateaus and mountains
Hartig--Landform: Mountains; geomorphic position:
 footslope; aspect: east
Rock outcrop--Landform: Plateaus
Inclusion 1--Landform: Mountains; geomorphic position:
 backslope; aspect: east
Inclusion 2--Landform: Ash flows; geomorphic position:
 backslope; aspect: north
Inclusion 3--Landform: Plateaus; geomorphic position:
 backslope; aspect: south
Inclusion 4--Landform: Plateaus; geomorphic position:
 backslope; aspect: south

Major Component Description

Hartig Series

Elevation: 5,700 to 6,000 feet
Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 40 percent
 gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic
 rocks

Rock outcrop Miscellaneous Area

Elevation: 5,700 to 6,000 feet
Drainage class: Excessively drained

Dominant Present Vegetation

Hartig: Idaho fescue, bluebunch wheatgrass, mountain big
 sagebrush
 Inclusion 1: Bluebunch wheatgrass
 Inclusion 2: Idaho fescue, Thurber needlegrass, low
 sagebrush
 Inclusion 3: Big sagebrush, bluebunch wheatgrass
 Inclusion 4: Thurber needlegrass, Wyoming big sagebrush

Ecological Site

Hartig: 023XY016NV
 Rock outcrop: none
 Inclusion 1: 023XY016NV
 Inclusion 2: 023XY079NV
 Inclusion 3: 023XY039NV
 Inclusion 4: 023XY006NV

1273--Hartig-Hapgood association

Composition

Major Components

Hartig very gravelly sandy loam, 50 to 70 percent slopes--
 60 percent

Hapgood very gravelly loam, 50 to 70 percent slopes--25
 percent

Contrasting Inclusions

Inclusion 1: Westbutte very gravelly loam, 30 to 70 percent
 slopes--9 percent
 Inclusion 2: Badgercamp very gravelly loam, 30 to 70
 percent slopes--4 percent
 Inclusion 3: Hapgood very gravelly loam, 30 to 50 percent
 slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
Hartig--Landform: Plateaus; geomorphic position:
 backslope; aspect: east
Hapgood--Landform: Plateaus; geomorphic position:
 backslope; aspect: north
Inclusion 1--Landform: Plateaus; geomorphic position:
 backslope; aspect: southeast
Inclusion 2--Landform: Plateaus; geomorphic position:
 shoulder
Inclusion 3--Landform: Plateaus; geomorphic position:
 backslope; shape of slope: concave

Major Component Description

Hartig Series

Elevation: 6,000 to 6,500 feet
Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 40 percent
 gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic
 rocks

Hapgood Series

Elevation: 6,000 to 6,500 feet

Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 60 days
Surface rock fragments: 2 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Hartig: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Hapgood: Idaho fescue, mountain big sagebrush, needlegrass, snowberry
 Inclusion 1: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Bluebunch wheatgrass, curleaf mountainmahogany, mountain big sagebrush
 Inclusion 3: Idaho fescue, mountain big sagebrush, needlegrass, snowberry

Ecological Site

Hartig: 023XY016NV
 Hapgood: 023XY065NV
 Inclusion 1: 023XY007NV
 Inclusion 2: 023XY026NV
 Inclusion 3: 023XY065NV

1275--Hart Camp stony loam, 8 to 30 percent slopes

Composition

Major Components

Hart Camp stony loam, 8 to 30 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Hartig gravelly loam, 8 to 30 percent slopes--8 percent
 Inclusion 2: Madeline stony loam, 4 to 15 percent slopes--4 percent
 Inclusion 3: Reywat very stony loam, 4 to 15 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
 Hart Camp--Landform: Plateaus; geomorphic position: backslope; aspect: south
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; position on slope: upper
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave
 Inclusion 3--Landform: Plateaus; geomorphic position: summit; aspect: southwest

Major Component Description

Hart Camp Series

Elevation: 5,800 to 6,500 feet
Precipitation: About 11 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days

Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Hart Camp: 023XY015NV
 Inclusion 1: 023XY016NV
 Inclusion 2: 023XY015NV
 Inclusion 3: 023XY020NV

1276--Hart Camp-Reywat-Westbutte association

Composition

Major Components

Hart Camp stony loam, 30 to 50 percent slopes--40 percent
 Reywat stony loam, 30 to 50 percent slopes--30 percent
 Westbutte stony loam, 30 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hartig stony loam, 30 to 50 percent slopes--8 percent
 Inclusion 2: Newlands stony loam, 30 to 50 percent slopes--4 percent
 Inclusion 3: Fiddler very stony loam, 15 to 50 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
 Hart Camp--Landform: Plateaus; geomorphic position: backslope; aspect: east
 Reywat--Landform: Plateaus; geomorphic position: backslope; aspect: south
 Westbutte--Landform: Plateaus; geomorphic position: toeslope; aspect: north
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: east
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave; aspect: north
 Inclusion 3--Landform: Plateaus; geomorphic position: summit; position on slope: upper; aspect: south

Major Component Description

Hart Camp Series

Elevation: 5,500 to 6,200 feet
Precipitation: About 11 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days

Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Reywat Series

Elevation: 5,500 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 2 percent stones and boulders; 10 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Westbutte Series

Elevation: 5,500 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent stones and boulders; 10 percent cobbles; 20 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Reywat: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Westbutte: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Idaho fescue, mountain big sagebrush
 Inclusion 3: Big sagebrush, western juniper

Ecological Site

Hart Camp: 023XY015NV
 Reywat: 023XY039NV
 Westbutte: 023XY007NV
 Inclusion 1: 023XY016NV
 Inclusion 2: 023XY054NV
 Inclusion 3: 023XY024NV

1277--Hart Camp-Ninemile association

Composition

Major Components

Hart Camp stony loam, 4 to 30 percent slopes--60 percent
 Ninemile very gravelly loam, 4 to 30 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Tussock stony loam, 30 to 50 percent slopes--6 percent

Inclusion 2: Hartig very stony loam, 30 to 50 percent slopes--5 percent
 Inclusion 3: Lithic Argixerolls, loamy-skeletal, mixed, frigid very gravelly loam, 4 to 15 percent slopes--2 percent
 Inclusion 4: Vitrandic Cryoborolls, Ashy gravelly sandy loam, 4 to 15 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
 Hart Camp--Landform: Plateaus; geomorphic position: summit; shape of slope: concave
 Ninemile--Landform: Plateaus; geomorphic position: summit; shape of slope: convex
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: north
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: south
 Inclusion 3--Landform: Plateaus; geomorphic position: summit
 Inclusion 4--Landform: Plateaus; geomorphic position: toeslope; shape of slope: concave; aspect: north

Major Component Description

Hart Camp Series

Elevation: 6,500 to 6,900 feet
Precipitation: About 11 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days
Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Ninemile Series

Elevation: 6,500 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 75 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Hart Camp: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Ninemile: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 1: Idaho fescue, mountain big sagebrush
 Inclusion 2: Idaho fescue, Thurber needlegrass, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Idaho fescue, bluegrass, low sagebrush
 Inclusion 4: Idaho fescue, Nevada bluegrass, mountain big sagebrush

Ecological Site

Hart Camp: 023XY015NV
 Ninemile: 023XY017NV
 Inclusion 1: 023XY054NV
 Inclusion 2: 023XY016NV

Inclusion 3: 023XY008NV
Inclusion 4: 023XY084NV

1278--Boltz-Hart Camp association

Composition

Major Components

Boltz gravelly sandy loam, 4 to 30 percent slopes--60 percent
Hart Camp stony loam, 4 to 30 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Ashtr gravelly sandy loam, 8 to 15 percent slopes--5 percent
Inclusion 2: Menbo very gravelly loam, 8 to 30 percent slopes--5 percent
Inclusion 3: Tusune stony loam, 30 to 50 percent slopes--3 percent
Inclusion 4: Vitrandic Cryoborolls, Ashy gravelly sandy loam, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
Boltz--Landform: Plateaus; geomorphic position: shoulder; aspect: north
Hart Camp--Landform: Plateaus; geomorphic position: backslope
Inclusion 1--Landform: Ash flows; geomorphic position: shoulder; aspect: north

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north
Inclusion 4--Landform: Plateaus; geomorphic position: toeslope; shape of slope: concave

Major Component Description

Boltz Series

Elevation: 6,200 to 6,600 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 90 days
Surface rock fragments: 15 percent gravel
Surface layer texture: Gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Hart Camp Series

Elevation: 6,200 to 6,600 feet
Precipitation: About 11 inches
Air temperature: About 43 degrees
Frost-free season: About 70 days
Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Boltz: Idaho fescue, antelope bitterbrush, mountain big sagebrush, needlegrass
Hart Camp: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
Inclusion 1: Idaho fescue, antelope bitterbrush, mountain big sagebrush, needlegrass
Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
Inclusion 3: Idaho fescue, mountain big sagebrush
Inclusion 4: Idaho fescue, bluegrass, mountain big sagebrush, needlegrass

Ecological Site

Inclusion 2: 023XY007NV
Inclusion 3: 023XY054NV
Inclusion 4: 023XY084NV

1279--Hart Camp-Nutzan-Westbutte association

Composition

Major Components

Hart Camp stony loam, 4 to 30 percent slopes--40 percent
Nutzan gravelly sandy loam, 4 to 30 percent slopes--30 percent
Westbutte very gravelly loam, 4 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Lithic Argixerolls, loamy-skeletal, mixed, frigid extremely gravelly loam, 4 to 15 percent slopes--5 percent
Inclusion 2: Ashdos very gravelly fine sandy loam, 4 to 30 percent slopes--4 percent
Inclusion 3: Ninemile very cobbly loam, 4 to 15 percent slopes--3 percent
Inclusion 4: Tusune stony loam, 30 to 50 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
Hart Camp--Landform: Plateaus; geomorphic position: summit
Nutzan--Landform: Plateaus; geomorphic position: shoulder
Westbutte--Landform: Plateaus; geomorphic position: backslope
Inclusion 1--Landform: Plateaus; geomorphic position: summit
Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
Inclusion 3--Landform: Plateaus; geomorphic position: summit
Inclusion 4--Landform: Ash flows; geomorphic position: backslope; aspect: north

Major Component Description**Hart Camp Series**

Elevation: 6,200 to 6,800 feet
 Precipitation: About 11 inches
 Air temperature: About 43 degrees
 Frost-free season: About 70 days
 Surface rock fragments: 2 percent stones and boulders; 5 percent cobbles; 15 percent gravel
 Surface layer texture: Stony loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from tuffaceous rocks

Nutzan Series

Elevation: 6,200 to 6,800 feet
 Precipitation: About 14 inches
 Air temperature: About 44 degrees
 Frost-free season: About 70 days
 Surface rock fragments: 30 percent gravel
 Surface layer texture: Gravelly sandy loam
 Drainage class: Well drained
 Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Westbutte Series

Elevation: 6,200 to 6,800 feet
 Precipitation: About 12 inches
 Air temperature: About 45 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 10 percent cobbles; 40 percent gravel
 Surface layer texture: Very gravelly loam
 Drainage class: Well drained
 Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Hart Camp: Idaho fescue, Thurber needlegrass, antelope bitterbrush, bluebunch wheatgrass
 Nutzan: Idaho fescue, antelope bitterbrush, mountain big sagebrush, needlegrass
 Westbutte: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Idaho fescue, bluegrass, low sagebrush
 Inclusion 2: Idaho fescue, low sagebrush, needlegrass
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 4: Idaho fescue, mountain big sagebrush

Ecological Site

Hart Camp: 023XY015NV
 Nutzan: 023XY066NV
 Westbutte: 023XY007NV
 Inclusion 1: 023XY008NV
 Inclusion 2: 023XY079NV
 Inclusion 3: 023XY017NV
 Inclusion 4: 023XY054NV

1285--Zymans-Indian Creek association**Composition****Major Components**

Zymans cobbly loam, 4 to 15 percent slopes--60 percent
 Indian Creek very cobbly loam, 4 to 15 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Corral very cobbly loam, 4 to 8 percent slopes--8 percent
 Inclusion 2: Reywat very cobbly loam, 15 to 30 percent slopes--7 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
 Zymans--Landform: Hills; geomorphic position: backslope
 Indian Creek--Landform: Alluvial fans
 Inclusion 1--Landform: Hills; geomorphic position: shoulder
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope

Major Component Description**Zymans Series**

Elevation: 5,500 to 5,800 feet
 Precipitation: About 11 inches
 Air temperature: About 45 degrees
 Frost-free season: About 100 days
 Surface rock fragments: 10 percent cobbles; 5 percent gravel
 Surface layer texture: Cobbly loam
 Drainage class: Well drained
 Dominant parent material: Residuum derived from tuffaceous rocks

Indian Creek Series

Elevation: 5,500 to 5,800 feet
 Precipitation: About 11 inches
 Air temperature: About 48 degrees
 Frost-free season: About 90 days
 Surface rock fragments: 20 percent cobbles; 15 percent gravel
 Surface layer texture: Very cobbly loam
 Drainage class: Well drained
 Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Zymans: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Indian Creek: Bluegrass, low sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 2: Big sagebrush, bluebunch wheatgrass

Ecological Site

Zymans: 023XY020NV
 Indian Creek: 023XY059NV
 Inclusion 1: 023XY006NV
 Inclusion 2: 023XY039NV

1286--Zymans-Cotant-Hart Camp association**Composition****Major Components**

Zymans cobbly loam, 8 to 30 percent slopes--50 percent

Cotant very gravelly loam, 8 to 30 percent slopes--20 percent

Hart Camp stony loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Schamp very stony loam, 8 to 30 percent slopes--8 percent

Inclusion 2: Old Camp very stony loam, 15 to 30 percent slopes--7 percent

Map Unit Setting

Landscape position: Plateaus and hills

Zymans--Landform: Hills; geomorphic position: backslope; aspect: south

1290--Hapgood-Badgercamp-Hackwood association**Composition****Major Components**

Hapgood very gravelly loam, 15 to 30 percent slopes--40 percent

Badgercamp bouldery loam, 4 to 30 percent slopes--30 percent

Hackwood gravelly loam, 4 to 15 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hackwood very gravelly sandy loam, cold, 15 to 50 percent slopes--8 percent

Inclusion 2: Newlands very gravelly loam, 4 to 15 percent slopes--6 percent

Inclusion 3: Easte very cobbly loam, 15 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus

Hapgood--Landform: Plateaus; geomorphic position: backslope

Badgercamp--Landform: Plateaus; geomorphic position: shoulder

Hackwood--Landform: Plateaus; geomorphic position: toeslope

Inclusion 1--Landform: Plateaus; geomorphic position: backslope; position on slope: upper

Inclusion 2--Landform: Plateaus; geomorphic position: toeslope; shape of slope: concave

Inclusion 3--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave; aspect: north

Major Component Description**Hapgood Series**

Elevation: 6,500 to 6,900 feet

Precipitation: About 14 inches

Air temperature: About 42 degrees

Frost-free season: About 60 days

Surface rock fragments: 2 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Badgercamp Series

Elevation: 6,500 to 6,900 feet

Precipitation: About 16 inches

Air temperature: About 40 degrees

Frost-free season: About 50 days

Surface rock fragments: 2 percent stones and boulders; 2 percent cobbles; 10 percent gravel

Surface layer texture: Boulderly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Hackwood Series

Elevation: 6,500 to 6,900 feet

Precipitation: About 16 inches

Air temperature: About 41 degrees

Frost-free season: About 50 days

Surface rock fragments: 5 percent cobbles; 20 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Hapgood: Mountain big sagebrush, needlegrass, snowberry

Badgercamp: Idaho fescue, big sagebrush, curlleaf mountainmahogany, needlegrass

Hackwood: Bluegrass, quaking aspen, snowberry

Inclusion 1: Bitter cherry, quaking aspen, snowberry

Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Inclusion 3: Snowbrush ceanothus, white fir

Ecological Site

Hapgood: 023XY065NV

Major Component Description

Devoy Series

Elevation: 6,500 to 6,800 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 50 days

Surface rock fragments: 15 percent cobbles; 15 percent gravel

Surface layer texture: Cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Blizzard Series

Elevation: 6,500 to 6,800 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 50 days

Surface rock fragments: 1 percent stones and boulders; 20 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly silty clay loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Devoy: Idaho fescue, Thurber needlegrass, bluebunch wheatgrass, mountain big sagebrush

Blizzard: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 1: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 2: Idaho fescue, bluebunch wheatgrass, bluegrass, low sagebrush

Inclusion 3: Idaho fescue, mountain big sagebrush, needlegrass

Inclusion 4: Idaho fescue, mountain big sagebrush

1305--Updike-Mazuma association

Composition

Major Components

Updike silt loam, 0 to 2 percent slopes, rarely flooded--60 percent

Mazuma fine sandy loam, 0 to 4 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Longdis silt loam, 0 to 2 percent slopes--7 percent

Inclusion 2: Skullwak silt loam, 0 to 2 percent slopes--6 percent

Inclusion 3: Mazuma sandy loam, moist, 0 to 4 percent slopes--2 percent

Map Unit Setting

Landscape position: Bolsons

Updike--Landform: Lake terraces; shape of slope: concave

Mazuma--Landform: Lake terraces; shape of slope: convex

Inclusion 1--Landform: Lake terraces

Inclusion 2--Landform: Basin floors

Inclusion 3--Landform: Basin floors

Major Component Description

Updike Series

Elevation: 5,400 to 5,500 feet

Precipitation: About 10 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface layer texture: Silt loam

Drainage class: Moderately well drained

Dominant parent material: Alluvium derived from lacustrine sediments

Mazuma Series

Elevation: 5,400 to 5,500 feet

Precipitation: About 6 inches

Air temperature: About 50 degrees

Frost-free season: About 100 days

Surface layer texture: Fine sandy loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Updike: Basin wildrye, black greasewood, bottlebrush squirreltail, inland saltgrass

Mazuma: Bud sagebrush, shadscale

Inclusion 1: Big sagebrush, black greasewood

Inclusion 2: Nevada bluegrass, alkaligrass, inland saltgrass

Inclusion 3: Black greasewood, inland saltgrass

Ecological Site

Updike: 024XY008NV

Mazuma: 024XY065NV

1311--Longdis-Macyflet-Aeric Epiaquents association

Composition

Major Components

Longdis silt loam, 0 to 2 percent slopes--40 percent
Macyflet silt loam, 0 to 2 percent slopes--30 percent
Aeric Epiaquents silt loam, 0 to 1 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Davey loamy fine sand, 0 to 4 percent slopes--4 percent
Inclusion 2: Surprise gravelly loamy sand, 2 to 8 percent slopes--4 percent
Inclusion 3: Indian Creek very cobbly loam, 2 to 8 percent slopes--2 percent

Map Unit Setting

Landscape position: Bolsons
Longdis--Landform: Alluvial flats
Macyflet--Landform: Lake plains
Aeric Epiaquents--Landform: Lake plains; position on slope: lower
Inclusion 1--Landform: Beach terraces
Inclusion 2--Landform: Alluvial flats
Inclusion 3--Landform: Alluvial fans

Major Component Description

Longdis Series

Elevation: 5,670 to 5,750 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface layer texture: Silt loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from lacustrine sediments

Macyflet Series

Elevation: 5,670 to 5,750 feet
Precipitation: About 12 inches
Air temperature: About 43 degrees
Frost-free season: About 80 days
Surface layer texture: Silt loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from mixed rocks and lake sediments

Aeric Epiaquents Soils

Elevation: 5,650 to 5,720 feet
Precipitation: About 11 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface layer texture: Silt loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from lacustrine sediments

Dominant Present Vegetation

Longdis: Nevada bluegrass, silver sagebrush
Macyflet: Cusick bluegrass, Douglas rabbitbrush, Thurber needlegrass, alkali sagebrush, basin wildrye

Aeric Epiaquents: Mat muhly, other annual forbs, povertyweed
Inclusion 1: Basin big sagebrush, needleandthread
Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
Inclusion 3: Thurber needlegrass, bluegrass, low sagebrush

Ecological Site

Longdis: 023XY003NV

 Devada very stony loam, 8 to 30 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Uhaldi stony loam, 8 to 30 percent slopes--7 percent
 Inclusion 2: Westbutte very stony loam, 15 to 30 percent slopes--5 percent
 Inclusion 3: Old Camp very stony loam, 8 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus and hills
Reywat--Landform: Plateaus; geomorphic position: backslope
Devada--Landform: Plateaus; geomorphic position: summit
Inclusion 1--Landform: Hills; geomorphic position: backslope
Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: north
Inclusion 3--Landform: Plateaus; geomorphic position: backslope; position on slope: lower

Major Component Description**Reywat Series**

Elevation: 5,600 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 10 percent stones and boulders; 10 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Devada Series

Elevation: 5,600 to 6,200 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent stones and boulders; 15 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Reywat: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Devada: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Inclusion 1: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Thurber needlegrass, Wyoming big sagebrush, bluegrass

Ecological Site

Reywat: 023XY039NV
 Devada: 023XY031NV
 Inclusion 1: 023XY020NV
 Inclusion 2: 023XY007NV
 Inclusion 3: 023XY006NV

1335--Westbutte-Rock outcrop association**Composition****Major Components**

Westbutte stony loam, 30 to 50 percent slopes--70 percent
 Rock outcrop--15 percent

Contrasting Inclusions

Inclusion 1: Hackwood gravelly loam, 2 to 8 percent slopes--8 percent
 Inclusion 2: Fiddler very stony loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Madeline very stony loam, 8 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
Westbutte--Landform: Plateaus; geomorphic position: backslope; aspect: north
Rock outcrop--Landform: Plateaus
Inclusion 1--Landform: Plateaus; geomorphic position: toeslope; shape of slope: concave
Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: south
Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: east

Major Component Description**Westbutte Series**

Elevation: 5,500 to 5,700 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 2 percent stones and boulders; 10 percent cobbles; 20 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Rock outcrop Miscellaneous Area

Elevation: 5,500 to 5,700 feet
Drainage class: Excessively drained

Dominant Present Vegetation

Westbutte: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Rock outcrop: None

Inclusion 1: Quaking aspen, willow

Inclusion 2: Big sagebrush, western juniper

Inclusion 3: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Westbutte: 023XY007NV

Rock outcrop: none

Inclusion 1: 023XY028NV

Inclusion 2: 023XY024NV

Inclusion 3: 023XY015NV

1336--Westbutte-Ashtre-Tusune association**Composition****Major Components**

Westbutte very gravelly loam, 8 to 30 percent slopes--45 percent

Ashtre gravelly loam, 4 to 30 percent slopes--25 percent

Tusune stony loam, 30 to 50 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Westbutte extremely gravelly loam, 4 to 30 percent slopes--8 percent

Inclusion 2: Westbutte very gravelly loam, 30 to 50 percent slopes--3 percent

Inclusion 3: Nutzan very gravelly sandy loam, 4 to 30 percent slopes--3 percent

Inclusion 4: Ninemile very gravelly loam, 4 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus and mountains

Westbutte--Landform: Plateaus; geomorphic position: backslope; aspect: south

Ashtre--Landform: Plateaus; geomorphic position: shoulder; shape of slope: plane

Tusune--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: north

Inclusion 1--Landform: Plateaus; geomorphic position: shoulder

Inclusion 2--Landform: Mountains; geomorphic position: backslope; aspect: south

Inclusion 3--Landform: Mountains; geomorphic position: backslope

Inclusion 4--Landform: Plateaus; geomorphic position: summit

Major Component Description**Westbutte Series**

Elevation: 6,200 to 6,900 feet

Precipitation: About 12 inches

Air temperature: About 45 degrees

Frost-free season: About 90 days

Surface rock fragments: 10 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Colluvium derived from volcanic rocks

Ashtre Series

Elevation: 6,200 to 6,900 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 90 days

Surface rock fragments: 25 percent gravel

Surface layer texture: Gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Tusune Series

Elevation: 6,200 to 6,900 feet

Precipitation: About 14 inches

Air temperature: About 44 degrees

Frost-free season: About 70 days

Surface rock fragments: 1 percent stones and boulders; 2 percent cobbles; 25 percent gravel

Surface layer texture: Stony loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Westbutte: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ashtre: Idaho fescue, mountain big sagebrush, needlegrass

Tusune: Idaho fescue, mountain big sagebrush

Inclusion 1: Idaho fescue, mountain big sagebrush, needlegrass

Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush

Inclusion 3: Idaho fescue, antelope bitterbrush, mountain big sagebrush, needlegrass

Inclusion 4: Idaho fescue, bluebunch wheatgrass, low sagebrush

Ecological Site

Westbutte: 023XY007NV

Ashtre: 023XY094NV

Tusune: 023XY054NV

Inclusion 1: 023XY061NV

Inclusion 2: 023XY007NV

Inclusion 3: 023XY066NV

Inclusion 4: 023XY017NV

1345--Layview-Hapgood association**Composition****Major Components**

Layview very gravelly loam, 4 to 30 percent slopes--50 percent

Hapgood very gravelly loam, 4 to 30 percent slopes--35 percent

Contrasting Inclusions

Inclusion 1: Lithic Argixerolls, loamy-skeletal, mixed, frigid extremely gravelly sandy loam, 2 to 8 percent slopes--8 percent

- Inclusion 2: Badgercamp very stony loam, 4 to 30 percent slopes--4 percent
 Inclusion 3: Hackwood gravelly loam, cold, 15 to 30 percent slopes--3 percent

Map Unit Setting

Landscape position: Plateaus
Layview--Landform: Plateaus; geomorphic position: shoulder
Hapgood--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave; aspect: north
Inclusion 1--Landform: Plateaus; geomorphic position: summit
Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
Inclusion 3--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: north

Major Component Description

Layview Series

Elevation: 6,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Hapgood Series

Elevation: 6,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 60 days
Surface rock fragments: 2 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Layview: Idaho fescue, low sagebrush
Hapgood: Idaho fescue, mountain big sagebrush, needlegrass
Inclusion 1: Idaho fescue, bluegrass, low sagebrush
Inclusion 2: Idaho fescue, mountain big sagebrush, curlleaf mountainmahogany, needlegrass
Inclusion 3: Quaking aspen

Ecological Site

Layview: 023XY014NV

Inclusion 3--Landform: Depressions

Major Component Description

Layview Series

Elevation: 6,800 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 43 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Westbutte Series

Elevation: 6,500 to 7,000 feet
Precipitation: About 12 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 2 percent stones and boulders; 10 percent cobbles; 10 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Hapgood Series

Elevation: 6,500 to 7,000 feet
Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 60 days
Surface rock fragments: 2 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from volcanic rocks

Dominant Present Vegetation

Layview: Idaho fescue, low sagebrush

1355--Badgercamp-Hackwood-Easte association, 4 to 30 percent slopes

Composition

Major Components

Badgercamp bouldery loam, 4 to 30 percent slopes--50 percent
 Hackwood gravelly loam, 15 to 30 percent slopes--20 percent
 Easte very gravelly sandy loam, 15 to 30 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Hackwood gravelly loam, cold, 15 to 50 percent slopes--6 percent
 Inclusion 2: Westbutte very gravelly loam, 4 to 30 percent slopes--5 percent
 Inclusion 3: Pachic Cryoborolls, loamy-skeletal, mixed very gravelly loam, 15 to 30 percent slopes--2 percent
 Inclusion 4: Welch clay loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
 Badgercamp--Landform: Plateaus; geomorphic position: summit
 Hackwood--Landform: Plateaus; geomorphic position: backslope; position on slope: upper
 Easte--Landform: Plateaus; geomorphic position: shoulder; position on slope: upper; shape of slope: concave
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: north
 Inclusion 2--Landform: Plateaus; geomorphic position: shoulder
 Inclusion 3--Landform: Plateaus; geomorphic position:

backslope
 Inclusion 4--Landform: Inset fans

Major Component Description

Badgercamp Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 16 inches
Air temperature: About 40 degrees
Frost-free season: About 50 days
Surface rock fragments: 2 percent stones and boulders; 2 percent cobbles; 10 percent gravel
Surface layer texture: Bouldery loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Hackwood Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 16 inches
Air temperature: About 41 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 20 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Easte Series

Elevation: 6,000 to 7,000 feet
Precipitation: About 17 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 10 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Badgercamp: Idaho fescue, mountain big sagebrush, curlleaf mountainmahogany, needlegrass
 Hackwood: Bluegrass, quaking aspen, snowberry
 Easte: Snowbrush ceanothus, white fir
 Inclusion 1: Bluegrass, quaking aspen, snowberry
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Mountain big sagebrush, mountain brome, needlegrass
 Inclusion 4: Bluegrass, rush

Ecological Site

Badgercamp: 023XY026NV

 Inclusion 3: 023XY016NV

1360--Welch clay loam, 0 to 4 percent slopes**Composition****Major Components**

Welch clay loam, 0 to 4 percent slopes--90 percent

Contrasting Inclusions

Inclusion 1: Welch loam, 0 to 2 percent slopes, rarely flooded--8 percent
 Inclusion 2: Cumulic Haploxerolls, fine-loamy, mixed, frigid fine sandy loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Fan piedmonts
 Welch--Landform: Inset fans
 Inclusion 1--Landform: Alluvial fans
 Inclusion 2--Landform: Inset fans

Major Component Description**Welch Series**

Elevation: 6,200 to 6,800 feet
 Precipitation: About 14 inches
 Air temperature: About 43 degrees
 Frost-free season: About 60 days
 Surface layer texture: Clay loam
 Drainage class: Very poorly drained
 Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Welch: Bluegrass, rush, sedge
 Inclusion 1: Nevada bluegrass
 Inclusion 2: Basin big sagebrush, basin wildrye

Ecological Site

Welch: 023XY025NV
 Inclusion 1: 023XY013NV
 Inclusion 2: 023XY005NV

1361--Wetvit association**Composition****Major Components**

Wetvit fine sandy loam, 0 to 2 percent slopes--50 percent
 Wetvit fine sandy loam, 0 to 2 percent slopes, occasionally flooded--40 percent

Contrasting Inclusions

Inclusion 1: Weezweed loam, 0 to 2 percent slopes--5 percent
 Inclusion 2: Updike silt loam, 0 to 2 percent slopes--3 percent
 Inclusion 3: Skullwak silt loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Intermontane basins
 Wetvit--Landform: Flood plains; position on slope: lower
 Wetvit--Landform: Flood plains; position on slope: upper
 Inclusion 1--Landform: Stream terraces
 Inclusion 2--Landform: Lake terraces
 Inclusion 3--Landform: Basin floors

Major Component Description**Wetvit Series**

Elevation: 4,400 to 5,600 feet
 Precipitation: About 10 inches
 Air temperature: About 46 degrees
 Frost-free season: About 90 days
 Surface layer texture: Fine sandy loam
 Drainage class: Very poorly drained
 Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Wetvit Series

Elevation: 4,400 to 5,600 feet
 Precipitation: About 10 inches
 Air temperature: About 46 degrees
 Frost-free season: About 90 days
 Surface layer texture: Fine sandy loam

Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Wetvit: Nevada bluegrass, rush, sedge
 Wetvit: Nevada bluegrass, sedge
 Inclusion 1: Basin big sagebrush, basin wildrye
 Inclusion 2: Nevada bluegrass, basin wildrye, black greasewood, rubber rabbitbrush
 Inclusion 3: Nevada bluegrass, alkaligrass, inland saltgrass

Ecological Site

Wetvit: 023XY089NV

1365--Rubble land-Dosie association

Composition

Major Components

Rubble land fragmental material, 30 to 50 percent slopes--60 percent
 Dosie very stony loam, 30 to 50 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Pachic Argixerolls, loamy-skeletal, mixed, frigid very stony loam, 30 to 70 percent slopes--10 percent
 Inclusion 2: Fiddler extremely stony loam, 30 to 50 percent slopes--2 percent
 Inclusion 3: Westbutte extremely stony loam, 15 to 50 percent slopes--2 percent
 Inclusion 4: Hackwood gravelly loam, 15 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus
Rubble land--Landform: Plateaus
Dosie--Landform: Plateaus; geomorphic position: backslope
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; shape of slope: concave
 Inclusion 2--Landform: Plateaus; geomorphic position: shoulder; aspect: south
 Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north
 Inclusion 4--Landform: Plateaus; geomorphic position: backslope; position on slope: upper; aspect: north

Major Component Description

Rubble land Miscellaneous Area

Elevation: 5,700 to 6,200 feet
Surface layer texture: Fragmental material
Drainage class: Excessively drained

Dosie Series

Elevation: 5,700 to 6,200 feet

Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 10 percent stones and boulders; 10 percent cobbles; 30 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Rubble land: None
 Dosie: Antelope bitterbrush, basin wildrye, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Basin wildrye, big sagebrush, bluebunch wheatgrass
 Inclusion 2: Big sagebrush, western juniper
 Inclusion 3: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 4: Quaking aspen

Ecological Site

Dosie: 023XY016NV
 Rubble land: none
 Inclusion 1: 023XY041NV
 Inclusion 2: 023XY024NV
 Inclusion 3: 023XY007NV
 Inclusion 4: 023XY028NV

1366--Dosie very stony loam, 15 to 50 percent slopes

Composition

Major Components

Dosie very stony loam, 15 to 50 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Pachic Argixerolls, loamy-skeletal, mixed, frigid stony loam, 15 to 50 percent slopes--10 percent
 Inclusion 2: Westbutte stony loam, 15 to 30 percent slopes--2 percent
 Inclusion 3: Zymans very cobbly loam, 15 to 30 percent slopes--2 percent
 Inclusion 4: Hart Camp stony loam, 15 to 30 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus and hills
Dosie--Landform: Plateaus; geomorphic position: backslope
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope; aspect: northeast
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: north
 Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: lower
 Inclusion 4--Landform: Pediments

Major Component Description

Dosie Series

Elevation: 5,600 to 6,600 feet

Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 10 percent stones and boulders;
 10 percent cobbles; 30 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Dosie: Basin wildrye, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: Bluebunch wheatgrass, mountain big sagebrush
 Inclusion 2: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 4: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Dosie: 023XY016NV
 Inclusion 1: 023XY041NV
 Inclusion 2: 023XY007NV
 Inclusion 3: 023XY020NV
 Inclusion 4: 023XY015NV

1367--Dosie-Fiddler-Rubble land association

Composition

Major Components

Dosie very stony loam, 30 to 50 percent slopes--40 percent
 Fiddler very stony loam, 30 to 50 percent slopes--25 percent
 Rubble land fragmental material, 30 to 50 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Devada very stony loam, 15 to 50 percent slopes--6 percent
 Inclusion 2: Bucklake very stony loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Westbutte stony loam, 15 to 50 percent slopes--3 percent
 Inclusion 4: Hart Camp stony loam, 15 to 30 percent slopes--2 percent

Map Unit Setting

Landscape position: Plateaus
 Dosie--Landform: Plateaus; geomorphic position: backslope
 Fiddler--Landform: Plateaus; geomorphic position: backslope; position on slope: upper
 Rubble land--Landform: Escarpments
 Inclusion 1--Landform: Plateaus
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; aspect: south
 Inclusion 3--Landform: Plateaus; geomorphic position: backslope; aspect: north

Inclusion 4--Landform: Pediments; aspect: east

Major Component Description

Dosie Series

Elevation: 5,700 to 6,200 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 10 percent stones and boulders;
 10 percent cobbles; 30 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Fiddler Series

Elevation: 5,700 to 6,200 feet
Precipitation: About 13 inches
Air temperature: About 45 degrees
Frost-free season: About 80 days
Surface rock fragments: 10 percent stones and boulders;
 15 percent cobbles; 20 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Rubble land Miscellaneous Area

Elevation: 5,700 to 6,200 feet
Surface layer texture: Fragmental material
Drainage class: Excessively drained

Dominant Present Vegetation

Dosie: Basin wildrye, bluebunch wheatgrass, mountain big sagebrush
 Fiddler: Bluebunch wheatgrass, western juniper
 Rubble land: None
 Inclusion 1: Thurber needlegrass, bluebunch wheatgrass, low sagebrush
 Inclusion 2: Big sagebrush, bluebunch wheatgrass
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 4: Antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush

Ecological Site

Dosie: 023XY016NV
 Fiddler: 023XY024NV
 Rubble land: none
 Inclusion 1: 023XY031NV
 Inclusion 2: 023XY039NV
 Inclusion 3: 023XY007NV
 Inclusion 4: 023XY015NV

1375--Cotant-Madeline association

Composition

Major Components

Cotant very gravelly loam, 4 to 15 percent slopes--60 percent

Madeline very cobbly loam, 4 to 15 percent slopes--25 percent

Contrasting Inclusions

Inclusion 1: Ninemile very cobbly loam, 4 to 15 percent slopes--8 percent

Inclusion 2: Newlands stony loam, 4 to 15 percent slopes--7 percent

Map Unit Setting

Landscape position: Plateaus

Cotant--Landform: Plateaus; *geomorphic position:* toeslope

Madeline--Landform: Plateaus; *geomorphic position:* summit

Inclusion 1--Landform: Plateaus

Inclusion 2--Landform: Plateaus; *geomorphic position:* backslope; *aspect:* north

Major Component Description

Cotant Series

Elevation: 6,500 to 6,800 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 80 days

Surface rock fragments: 5 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Residuum and colluvium derived from tuffaceous rocks

Madeline Series

Elevation: 6,500 to 6,800 feet

Precipitation: About 13 inches

Air temperature: About 44 degrees

Frost-free season: About 80 days

Surface rock fragments: 20 percent cobbles; 30 percent gravel

Surface layer texture: Very cobbly loam

Drainage class: Well drained

Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Cotant: Idaho fescue, bluebunch wheatgrass, low sagebrush

Madeline: Antelope bitterbrush, bluegrass, mountain big sagebrush

Inclusion 1: Idaho fescue, bluebunch wheatgrass, low sagebrush

Inclusion 2: Idaho fescue, mountain big sagebrush, needlegrass

Ecological Site

Cotant: 023XY017NV

Madeline: 023XY015NV

Inclusion 1: 023XY017NV

Inclusion 2: 023XY065NV

1380--Weimer-Boulder Lake association

Composition

Major Components

Weimer clay, 0 to 2 percent slopes--70 percent

Boulder Lake silty clay, 0 to 2 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Welch loam, 0 to 2 percent slopes, rarely flooded--8 percent

Inclusion 2: Macyflet silt loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Lake plains

Weimer--Landform: Lake plains; *position on slope:* lower

Boulder Lake--Landform: Lake plains

Inclusion 1--Landform: Inset fans

Inclusion 2--Landform: Lake plains

Major Component Description

Weimer Series

Elevation: 5,500 to 6,500 feet

Precipitation: About 12 inches

Air temperature: About 43 degrees

Frost-free season: About 60 days

Surface layer texture: Clay

Drainage class: Poorly drained

Dominant parent material: Alluvium derived from mixed rocks and lake sediments

Boulder Lake Series

Elevation: 5,500 to 6,500 feet

Precipitation: About 12 inches

Air temperature: About 43 degrees

Frost-free season: About 80 days

Surface layer texture: Silty clay

Drainage class: Very poorly drained

Dominant parent material: Alluvium derived from mixed rocks and lake sediments

Dominant Present Vegetation

Weimer: Rush, sedge

Boulder Lake: Bluegrass, silver sagebrush

Inclusion 1: Nevada bluegrass

Inclusion 2: Alkali sagebrush, bluegrass

Ecological Site

Weimer: 023XY023NV

Boulder Lake: 023XY003NV

Inclusion 1: 023XY013NV

Inclusion 2: 023XY090NV

1385--Fernpoint very gravelly sandy loam, 8 to 30 percent slopes

Composition

Major Components

Fernpoint very gravelly sandy loam, 8 to 30 percent slopes--85 percent

Contrasting Inclusions

- Inclusion 1: Davey loamy fine sand, 2 to 8 percent slopes--6 percent
 Inclusion 2: Schamp very gravelly loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Zymans very cobbly loam, 4 to 15 percent slopes--4 percent

Map Unit Setting

Landscape position: Hills and intermontane basins
Fernpoint--Landform: Beach terraces
Inclusion 1--Landform: Beach terraces
Inclusion 2--Landform: Hills; geomorphic position: backslope; position on slope: lower
Inclusion 3--Landform: Hills; geomorphic position: backslope; position on slope: upper

Major Component Description**Fernpoint Series**

Elevation: 5,500 to 6,000 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Fernpoint: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 1: Indian ricegrass, basin big sagebrush, needleandthread
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush
 Inclusion 3: Thurber needlegrass, big sagebrush, bluebunch wheatgrass

Ecological Site

Fernpoint: 023XY020NV
 Inclusion 1: 023XY051NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY020NV

1395--Orr-Fernpoint association**Composition****Major Components**

Orr sandy loam, 2 to 8 percent slopes--65 percent
 Fernpoint very gravelly sandy loam, 8 to 30 percent slopes--20 percent

Contrasting Inclusions

- Inclusion 1: Orr very gravelly sandy loam, 8 to 30 percent slopes--8 percent
 Inclusion 2: Fernpoint very stony loam, 4 to 30 percent slopes--5 percent
 Inclusion 3: Dugway silt loam, 0 to 2 percent slopes--2 percent

Map Unit Setting

Landscape position: Bolsons

Orr--Landform: Alluvial fans

Fernpoint--Landform: Beach terraces

Inclusion 1--Landform: Alluvial fans; geomorphic position: backslope

Inclusion 2--Landform: Beach terraces; position on slope: upper

Inclusion 3--Landform: Lake terraces; position on slope: lower

Major Component Description**Orr Series**

Elevation: 5,500 to 6,000 feet
Precipitation: About 11 inches
Air temperature: About 49 degrees
Frost-free season: About 90 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Fernpoint Series

Elevation: 5,500 to 6,000 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Orr: Thurber needlegrass, big sagebrush
 Fernpoint: Thurber needlegrass, big sagebrush, bluebunch wheatgrass
 Inclusion 1: Thurber needlegrass, big sagebrush, bluegrass
 Inclusion 2: Thurber needlegrass, big sagebrush, bluebunch wheatgrass, bluegrass
 Inclusion 3: Big sagebrush, bottlebrush squirreltail, rabbitbrush

Ecological Site

Orr: 023XY020NV
 Fernpoint: 023XY020NV
 Inclusion 1: 023XY020NV
 Inclusion 2: 023XY020NV
 Inclusion 3: 023XY005NV

1400--Bombadil-Ceejay association**Composition****Major Components**

Bombadil very stony loam, cool, 4 to 30 percent slopes--45 percent

Ceejay stony loam, 4 to 30 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Old Camp very stony sandy loam, 4 to 30 percent slopes--6 percent

- Inclusion 2: Reywat very stony loam, 15 to 50 percent slopes--4 percent
 Inclusion 3: Ceejay very stony sandy loam, 30 to 50 percent slopes--4 percent
 Inclusion 4: Rock outcrop--1 percent

Map Unit Setting

- Landscape position:* Plateaus
 Bombadil--Landform: Plateaus; geomorphic position: summit
 Ceejay--Landform: Plateaus; geomorphic position: summit
 Inclusion 1--Landform: Plateaus; geomorphic position: backslope
 Inclusion 2--Landform: Plateaus; geomorphic position: backslope; position on slope: upper
 Inclusion 3--Landform: Plateaus; geomorphic position: backslope
 Inclusion 4--Landform: Plateaus

Major Component Description

Bombadil Series

- Elevation:* 4,800 to 5,000 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent stones and boulders; 10 percent cobbles; 25 percent gravel
Surface layer texture: Very stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Ceejay Series

- Elevation:* 4,800 to 5,000 feet
Precipitation: About 9 inches
Air temperature: About 49 degrees
Frost-free season: About 100 days
Surface rock fragments: 2 percent stones and boulders; 10 percent cobbles; 40 percent gravel
Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

- Bombadil: Thurber needlegrass, Wyoming big sagebrush
 Ceejay: Thurber needlegrass, bluegrass, sagebrush
 Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bluegrass
 Inclusion 2: Thurber needlegrass, big sagebrush
 Inclusion 3: Thurber needlegrass, bluegrass, sagebrush
 Inclusion 4: None

Ecological Site

- Bombadil: 023XY006NV
 Ceejay: 023XY093NV
 Inclusion 1: 023XY006NV
 Inclusion 2: 023XY039NV
 Inclusion 3: 023XY093NV
 Inclusion 4: none

1410--Fulstone-Saraph-Tuffo association

Composition

Major Components

- Fulstone very gravelly sandy loam, 2 to 15 percent slopes--35 percent
 Saraph very gravelly sandy loam, 4 to 30 percent slopes--30 percent
 Tuffo very gravelly sandy loam, 15 to 50 percent slopes--20 percent

Contrasting Inclusions

- Inclusion 1: Vitrixerandic Haplargids, Ashy, mesic sandy loam, 0 to 4 percent slopes--5 percent
 Inclusion 2: Argidic Argidurids, loamy, mixed, mesic, shallow very gravelly sandy loam, 4 to 15 percent slopes--5 percent
 Inclusion 3: Ceejay very gravelly sandy loam, 4 to 15 percent slopes--5 percent

Map Unit Setting

- Landscape position:* Hills and intermontane basins
 Fulstone--Landform: Fan remnants; geomorphic position: summit
 Saraph--Landform: Ash flows; geomorphic position: backslope
 Tuffo--Landform: Ash flows; geomorphic position: backslope
 Inclusion 1--Landform: Inset fans
 Inclusion 2--Landform: Fan remnants; geomorphic position: shoulder
 Inclusion 3--Landform: Plateaus; geomorphic position: summit

Major Component Description

Fulstone Series

- Elevation:* 5,300 to 5,800 feet
Precipitation: About 9 inches
Air temperature: About 51 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent cobbles; 45 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Saraph Series

- Elevation:* 5,300 to 5,800 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 50 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Residuum derived from tuffaceous rocks

Tuffo Series

- Elevation:* 5,300 to 5,800 feet
Precipitation: About 10 inches
Air temperature: About 45 degrees
Frost-free season: About 100 days
Surface rock fragments: 35 percent gravel

Surface layer texture: Very gravelly sandy loam
Drainage class: Somewhat excessively drained
Dominant parent material: Residuum derived from tuffaceous rocks

Dominant Present Vegetation

Fulstone: Thurber needlegrass, bluegrass, sagebrush
 Saraph: Thurber needlegrass, Wyoming big sagebrush, bluegrass
 Tuffo: Wyoming big sagebrush, needlegrass, sagebrush
 Inclusion 1: Douglas rabbitbrush, basin big sagebrush, basin wildrye, rubber rabbitbrush
 Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, bluegrass
 Inclusion 3: Thurber needlegrass, bluegrass, sagebrush

Ecological Site

Fulstone: 023XY093NV
 Saraph: 023XY006NV
 Tuffo: 023XY088NV
 Inclusion 1: 023XY082NV
 Inclusion 2: 023XY006NV
 Inclusion 3: 023XY093NV

1412--Fulstone-Nellspring-Bufferan association

Composition

Major Components

Fulstone very gravelly sandy loam, 2 to 15 percent slopes--40 percent
 Nellspring very gravelly fine sandy loam, 2 to 15 percent slopes--25 percent
 Bufferan gravelly loam, 2 to 15 percent slopes--20 percent

Contrasting Inclusions

Inclusion 1: Abruptic Xeric Argidurids, clayey, montmorillonitic, mesic, shallow very gravelly fine sandy loam, 4 to 15 percent slopes--6 percent
 Inclusion 2: Aridic Haploxererts, fine, montmorillonitic, mesic cobbly clay, 0 to 4 percent slopes--5 percent
 Inclusion 3: Aridic Haploxererts, fine, montmorillonitic, mesic cobbly clay, 0 to 4 percent slopes--3 percent
 Inclusion 4: Rock outcrop--1 percent

Map Unit Setting

Landscape position: Plateaus and adjacent bolsons
 Fulstone--Landform: Fan remnants; geomorphic position: summit
 Nellspring--Landform: Fan remnants; geomorphic position: summit; shape of slope: concave
 Bufferan--Landform: Fan remnants; geomorphic position: shoulder
 Inclusion 1--Landform: Fan remnants; geomorphic position: summit
 Inclusion 2--Landform: Plateaus; geomorphic position: toeslope; shape of slope: convex
 Inclusion 3--Landform: Depressions
 Inclusion 4--Landform: Plateaus

Major Component Description

Fulstone Series

Elevation: 5,500 to 5,900 feet
Precipitation: About 9 inches
Air temperature: About 51 degrees
Frost-free season: About 100 days
Surface rock fragments: 5 percent cobbles; 45 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Nellspring Series

Elevation: 5,500 to 5,900 feet
Precipitation: About 9 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 10 percent cobbles; 55 percent gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic rocks

Bufferan Series

Elevation: 5,500 to 5,900 feet
Precipitation: About 10 inches
Air temperature: About 47 degrees
Frost-free season: About 90 days
Surface rock fragments: 5 percent cobbles; 20 percent gravel
Surface layer texture: Gravelly loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from mixed rocks

Dominant Present Vegetation

Fulstone: Thurber needlegrass, bluegrass, sagebrush
 Nellspring: Sandberg bluegrass, Thurber needlegrass, bottlebrush squirreltail, sagebrush
 Bufferan: Thurber needlegrass, Wyoming big sagebrush, bluegrass
 Inclusion 1: Thurber needlegrass, bluegrass, low sagebrush
 Inclusion 2: Thurber needlegrass, bluegrass, sagebrush
 Inclusion 3: Low sagebrush, rubber rabbitbrush
 Inclusion 4: None

Ecological Site

Fulstone: 023XY093NV
 Nellspring: 023XY047NV
 Bufferan: 023XY006NV
 Inclusion 1: 023XY059NV
 Inclusion 2: 023XY093NV
 Inclusion 3: 023XY001NV
 Inclusion 4: none

1420--Hangrock very gravelly loam, 2 to 15 percent slopes**Composition****Major Components**

Hangrock very gravelly loam, 2 to 15 percent slopes--85 percent

Contrasting Inclusions

Inclusion 1: Saraph very gravelly sandy loam, 4 to 30 percent slopes--5 percent

Inclusion 2: Vitrikerandic Haplargids, Ashy, mesic sandy loam, 0 to 4 percent slopes--4 percent

Inclusion 3: Fulstone very gravelly sandy loam, 2 to 15 percent slopes--3 percent

Inclusion 4: Tuffo very gravelly sandy loam, 15 to 50 percent slopes--3 percent

Map Unit Setting

Landscape position: Fan piedmonts

Hangrock--Landform: Fan remnants; geomorphic position: summit

Inclusion 1--Landform: Alluvial fans; geomorphic position: shoulder

Inclusion 2--Landform: Inset fans

Inclusion 3--Landform: Fan remnants; geomorphic position: summit

Inclusion 4--Landform: Alluvial fans; geomorphic position: backslope

Major Component Description**Hangrock Series**

Elevation: 5,400 to 5,800 feet

Precipitation: About 10 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 5 percent cobbles; 40 percent gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Hangrock: Thurber needlegrass, Wyoming big sagebrush, bottlebrush squirreltail

Inclusion 1: Thurber needlegrass, Wyoming big sagebrush, bluegrass

Inclusion 2: Douglas rabbitbrush, basin big sagebrush, basin wildrye, rubber rabbitbrush

Inclusion 3: Thurber needlegrass, bluegrass, sagebrush

Inclusion 4: Wyoming big sagebrush, needlegrass, sagebrush

Ecological Site

Hangrock: 023XY006NV

Inclusion 4: 023XY088NV

1430--Grassycan association
Composition**Major Components**

Grassycan very stony fine sandy loam, 2 to 15 percent slopes--45 percent

Grassycan extremely stony fine sandy loam, 0 to 8 percent slopes--40 percent

Contrasting Inclusions

Inclusion 1: Ceejay very stony fine sandy loam, 4 to 15 percent slopes--6 percent

Inclusion 2: Bombadil stony sandy loam, cool, 4 to 15 percent slopes--4 percent

Inclusion 3: Devada very stony loam, 4 to 15 percent slopes--3 percent

Inclusion 4: Rock outcrop--2 percent

Map Unit Setting

Landscape position: Plateaus

Grassycan--Landform: Plateaus; geomorphic position: summit

Grassycan--Landform: Plateaus; geomorphic position: summit; shape of slope: convex

Inclusion 1--Landform: Plateaus; geomorphic position: summit; position on slope: lower

Inclusion 2--Landform: Plateaus; geomorphic position: shoulder

Inclusion 3--Landform: Plateaus; geomorphic position: shoulder; position on slope: upper

Inclusion 4--Landform: Plateaus

Major Component Description**Grassycan Series**

Elevation: 5,500 to 6,000 feet

Precipitation: About 10 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 4 percent stones and boulders; 10 percent cobbles; 45 percent gravel

Surface layer texture: Very stony fine sandy loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Grassycan Series

Elevation: 5,500 to 6,000 feet

Precipitation: About 10 inches

Air temperature: About 46 degrees

Frost-free season: About 90 days

Surface rock fragments: 20 percent stones and boulders; 10 percent cobbles; 40 percent gravel

Surface layer texture: Extremely stony fine sandy loam

Drainage class: Well drained

Dominant parent material: Residuum derived from volcanic rocks

Dominant Present Vegetation

Grassycan: Thurber needlegrass, bluegrass, low sagebrush

Grassycan: Bluegrass, low sagebrush

Inclusion 1: Thurber needlegrass, bluegrass, sagebrush

Inclusion 2: Thurber needlegrass, Wyoming big sagebrush, bluegrass

Inclusion 3: Thurber needlegrass, bluebunch wheatgrass,
low sagebrush
Inclusion 4: None

Ecological Site

1431--Esmod-Powlow association

Composition

Major Components

Esmod very gravelly fine sandy loam, 2 to 15 percent
slopes--50 percent
Powlow very gravelly loam, 2 to 15 percent slopes--35
percent

Contrasting Inclusions

Inclusion 1: Vitriexerandic Haplocambids, Ashy, mesic
sandy loam, 0 to 4 percent slopes--7 percent
Inclusion 2: Wetvit loam, 0 to 4 percent slopes,
occasionally flooded--3 percent
Inclusion 3: Uhaldi stony loam, 2 to 15 percent slopes--3
percent
Inclusion 4: Tunnison clay, 2 to 8 percent slopes--2
percent

Map Unit Setting

Landscape position: Fan piedmonts
Esmod--Landform: Fan remnants; geomorphic position:
summit
Powlow--Landform: Fan remnants; geomorphic position:
shoulder
Inclusion 1--Landform: Inset fans
Inclusion 2--Landform: Stream terraces
Inclusion 3--Landform: Pediments; geomorphic position:
backslope
Inclusion 4--Landform: Depressions; shape of slope:
concave

Major Component Description

Esmod Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days
Surface rock fragments: 2 percent cobbles; 50 percent
gravel
Surface layer texture: Very gravelly fine sandy loam
Drainage class: Well drained
Dominant parent material: Alluvium derived from volcanic
rocks

Powlow Series

Elevation: 5,800 to 6,300 feet
Precipitation: About 11 inches
Air temperature: About 45 degrees
Frost-free season: About 90 days

Surface rock fragments: 2 percent cobbles; 40 percent
gravel

Surface layer texture: Very gravelly loam

Drainage class: Well drained

Dominant parent material: Alluvium derived from volcanic
rocks

Dominant Present Vegetation

Esmod: Thurber needlegrass, bluegrass, low sagebrush
Powlow: Thurber needlegrass, big sagebrush, bluebunch
wheatgrass
Inclusion 1: Basin big sagebrush, basin wildrye
Inclusion 2: Nevada bluegrass, basin big sagebrush
Inclusion 3: Thurber needlegrass, big sagebrush,
bluebunch wheatgrass
Inclusion 4: Low sagebrush, rubber rabbitbrush

Ecological Site

Esmod: 023XY059NV

Inclusion 4: 023XY001NV

1440--Tusune-Hartig association

Composition

Major Components

Tusune stony loam, 30 to 50 percent slopes--50 percent
Hartig very gravelly sandy loam, 30 to 50 percent slopes--
40 percent

Contrasting Inclusions

Inclusion 1: Rubble land fragmental material--4 percent
Inclusion 2: Hart Camp stony loam, 15 to 30 percent
slopes--3 percent
Inclusion 3: Ninemile stony loam, 15 to 30 percent slopes--
2 percent
Inclusion 4: Cumulic Haploxerolls, fine-loamy, mixed, frigid
loam, 2 to 8 percent slopes--1 percent

Map Unit Setting

Landscape position: Plateaus
Tusune--Landform: Plateaus; geomorphic position:
backslope; aspect: north
Hartig--Landform: Plateaus; geomorphic position:
backslope; aspect: south
Inclusion 1--Landform: Plateaus
Inclusion 2--Landform: Plateaus; geomorphic position:
shoulder
Inclusion 3--Landform: Plateaus; geomorphic position:
shoulder
Inclusion 4--Landform: Inset fans

Major Component Description

Tusune Series

Elevation: 6,300 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 44 degrees
Frost-free season: About 70 days
Surface rock fragments: 1 percent stones and boulders; 2
percent cobbles; 25 percent gravel

Surface layer texture: Stony loam
Drainage class: Well drained
Dominant parent material: Residuum and colluvium derived from pyroclastic and extrusive volcanic rocks

Hartig Series

Elevation: 6,300 to 6,900 feet
Precipitation: About 14 inches
Air temperature: About 42 degrees
Frost-free season: About 50 days
Surface rock fragments: 5 percent cobbles; 40 percent gravel
Surface layer texture: Very gravelly sandy loam
Drainage class: Well drained
Dominant parent material: Colluvium derived from volcanic rocks

Dominant Present Vegetation

Tussock: Idaho fescue, mountain big sagebrush
 Hartig: Idaho fescue, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 1: None
 Inclusion 2: Idaho fescue, antelope bitterbrush, bluebunch wheatgrass, mountain big sagebrush
 Inclusion 3: Idaho fescue, bluebunch wheatgrass, low sagebrush
 Inclusion 4: Basin big sagebrush, basin wildrye

Ecological Site

Tussock: 023XY054NV
 Hartig: 023XY016NV
 Inclusion 1: none
 Inclusion 2: 023XY015NV
 Inclusion 3: 023XY017NV
 Inclusion 4: 023XY009NV

1450--Emagert-Wetvit association**Composition****Major Components**

Emagert loam, 0 to 2 percent slopes--70 percent
 Wetvit fine sandy loam, 0 to 2 percent slopes--15 percent

Contrasting Inclusions

Inclusion 1: Weezweed loam, 0 to 2 percent slopes--7 percent
 Inclusion 2: Vitrikerandic Haplargids, Ashy, mesic fine sandy loam, 0 to 4 percent slopes--5 percent
 Inclusion 3: Wetvit fine sandy loam, 0 to 2 percent slopes, occasionally flooded--3 percent

Map Unit Setting

Landscape position: Intermontane basins
 Emagert--Landform: Stream terraces; position on slope: upper
 Wetvit--Landform: Flood plains
 Inclusion 1--Landform: Stream terraces; position on slope: upper
 Inclusion 2--Landform: Inset fans
 Inclusion 3--Landform: Flood plains

Major Component Description**Emagert Series**

Elevation: 5,000 to 5,700 feet
Precipitation: About 12 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface layer texture: Loam
Drainage class: Moderately well drained
Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Wetvit Series

Elevation: 5,000 to 5,700 feet
Precipitation: About 10 inches
Air temperature: About 46 degrees
Frost-free season: About 90 days
Surface rock fragments: 10 percent gravel
Surface layer texture: Fine sandy loam
Drainage class: Very poorly drained
Dominant parent material: Alluvium derived from pyroclastic and extrusive volcanic rocks

Dominant Present Vegetation

Emagert: Basin big sagebrush, basin wildrye, rubber rabbitbrush
 Wetvit: Baltic rush, Nebraska sedge, Nevada bluegrass
 Inclusion 1: Basin big sagebrush, basin wildrye, rubber rabbitbrush
 Inclusion 2: Indian ricegrass, Thurber needlegrass, Wyoming big sagebrush, basin wildrye
 Inclusion 3: Baltic rush, Nevada bluegrass, meadow barley

Ecological Site

Water: none

Prime Farmland

Prime Farmland and Other Important Farmland

In this section, prime farmland and other important farmland are defined. The map units in the survey area that are considered prime farmland are listed under "Prime Farmland Map Units" at the end of this section.

Prime Farmland

Prime farmland is of major importance in meeting the Nation's short- and long-range needs for food and fiber. The acreage of high-quality farmland is limited, and the U.S. Department of Agriculture recognizes that government at local, State, and Federal levels, as well as individuals, must encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland soils, as defined by the U.S. Department of Agriculture, are soils that are best suited to food, seed, forage, fiber, and oilseed crops. Such soils have properties that favor the economic production of sustained high yields of crops. The soils need only to be treated and managed by acceptable farming methods. An adequate moisture supply and a sufficiently long growing season are required. Prime farmland soils produce the highest yields with minimal expenditure of energy and economic resources, and farming these soils results in the least damage to the environment.

Prime farmland soils may presently be used as cropland, pasture, woodland or for other purposes. They are used for food and fiber or are available for these uses. Urban or built-up land and water areas cannot be considered prime farmland. Urban or built-up land is any contiguous unit of 10 acres or more in size that is used for such purposes as housing, industrial, and commercial sites, sites for institutions or public buildings, small parks, golf courses, cemeteries, railroad yards, airports, sanitary landfills, sewage treatment plants, and water-control structures.

Prime farmland soils commonly receive an adequate and dependable supply of moisture from precipitation or irrigation. The temperature and growing season are favorable, and the level of acidity or alkalinity and the content of salts and sodium are acceptable. The soils have few, if any, rocks and are permeable to water and air. They are not excessively erodible or saturated with water for long periods, and they are not frequently

flooded during the growing season or are protected from flooding. Slopes range mainly from 0 to 6 percent.

Soils that have a high water table, are subject to flooding, or are droughty may qualify as prime farmland where these limitations are overcome by drainage measures, flood control, or irrigation. Onsite evaluation is necessary to determine the effectiveness of corrective measures. More information about the criteria for prime farmland can be obtained at the local office of the Natural Resources Conservation Service.

A recent trend in land use has been the conversion of prime farmland to urban and industrial uses. The loss of prime farmland to other uses puts pressure on lands that are less productive than prime farmland.

About 2100 acres would meet the requirements for prime farmland if an adequate and dependable supply of irrigation water were available.

The map units in the survey area that meet the requirements for prime farmland are listed under "Prime Farmland Map Units." On some soils included in the list, measures that overcome limitations are needed. The location of each map unit is shown on the detailed soil maps at the back of this publication. This list does not constitute a recommendation for a particular land use.

Unique Farmland

Unique farmland is land other than prime farmland that is used for the production of specific high-value food and fiber crops. It has the special combination of soil qualities, location, growing season, and moisture supply needed for the economic production of sustained high yields of a specific high-quality crop when treated and managed by acceptable farming methods. Examples of such crops are citrus, tree nuts, olives, cranberries, and vegetables.

Unique farmland is used for a specific high-value food or fiber crop; has an adequate supply of available moisture for the specific crop because of stored moisture, precipitation, or irrigation; and has a combination of soil qualities, growing season, temperature, humidity, air drainage, elevation, aspect, and other factors, such as nearness to markets, that favor the production of a specific food or fiber crop.

Lists of unique farmland are developed as needed in cooperation with conservation districts and other entities. There are presently no soils recognized as unique farmland in Nevada.

Additional Farmland of Statewide Importance

Some areas other than areas of prime and unique farmland are of statewide importance in the production of food, feed, fiber, forage, and oilseed crops. The criteria used in defining and delineating these areas are determined by the appropriate State agency or agencies. Generally, additional farmland of statewide importance includes areas that nearly meet the criteria for prime farmland and that economically produce high yields of crops when treated and managed by acceptable farming methods. Some areas can produce as high a yield as areas of prime farmland if conditions are favorable. In some states additional farmland of statewide importance may include tracts of land that have been designated for agriculture by State law.

Nevada has designated any farmland that is irrigated to be of statewide importance.

Prime Farmland Map Units

The following map units would meet the criteria for prime farmland if irrigated with an adequate and dependable water supply:

1460 Weezweed loam, 0 to 2 percent slopes

In addition, the following map units would meet the criteria for prime farmland if irrigated and reclaimed to reduce excessive salinity and sodicity:

1140 Valmy very fine sandy loam, 0 to 2 percent slopes

1230 Raglan-Mazuma association

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories. Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 4, "Classification of the Soils," in Part II of this Publication shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

ORDER. Eleven soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Mollisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Xeroll (*Xer*, meaning *xeric*, plus *oll*, from *Mollisol*).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Argixeroll. (*Argi*, meaning *presence of argillic horizon*, plus *xeroll*, the suborder of the Mollisols that have a xeric moisture regime).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other known kind of soil. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic* identifies the subgroup that typifies the great group. An example is Typic Argixerolls.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineral content, temperature regime, thickness of the root zone, consistence, moisture equivalent, slope, and permanent cracks. A family name consists of the name of a subgroup

preceded by terms that indicate soil properties. An example is loamy-skeletal, mixed, frigid, Typic Argixerolls.

SERIES. The series consists of soils that have similar horizons in their profile. The horizons are similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. The texture of the surface layer or of the substratum can differ within a series.

Taxonomic Units and Their Morphology

In this section, each taxonomic unit recognized in the survey area is described. The descriptions are arranged in alphabetic order.

Characteristics of the soil and the material in which it formed are identified for each unit. A pedon, a small three-dimensional area of soil, that is typical of the unit in the survey area is described. The detailed description of each soil horizon follow standards in the "Soil Survey Manual" (7). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy" (8). Unless otherwise stated, colors in the descriptions are for dry soil. Following the pedon description is the range of important characteristics of the soils in the unit.

The map units of each taxonomic unit are described in the section "Detailed Soil Map Units".

Aeric Epiaquents

The Aeric Epiaquents consists of very deep, very poorly drained soils that formed in mixed lacustrine sediments on lake plains. Slopes are 0 to 1 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Frigid, Aeric Epiaquents

Typical pedon: Aeric Epiaquents silt loam, in map unit 1311, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; light brownish gray (2.5Y 6/2) silt loam, very dark grayish brown (2.5Y 3/2) moist; moderate thick platy structure; hard, friable, sticky and plastic; many very fine roots; common very fine vesicular

pores; strongly alkaline (pH 8.8); abrupt wavy boundary.

C1--4 to 12 inches; dark grayish brown (2.5Y 4/2) silty clay loam, very dark grayish brown (2.5Y 3/2) moist; moderate fine angular blocky structure; hard, friable, very sticky and very plastic; many very fine and fine roots; many very fine interstitial pores; strongly alkaline (pH 8.8); clear smooth boundary.

C2--12 to 19 inches; grayish brown (2.5Y 5/2) silty clay, very dark grayish brown (2.5Y 3/2) moist; strong medium prismatic structure; hard, friable, very sticky and very plastic; common very fine roots; common very fine interstitial pores; few fine distinct dark yellowish brown (10YR 4/4) redox concentrations, very dark brown (7.5YR 2/2) moist; slightly effervescent; strongly alkaline (pH 8.9); clear wavy boundary.

Ck1--19 to 26 inches; grayish brown (2.5Y 5/2) silty clay, dark grayish brown (2.5Y 4/2) moist; massive; hard, firm, very sticky and very plastic; few very fine roots; few very fine tubular pores; strongly effervescent; strongly alkaline (pH 9.2); clear smooth boundary.

Ck2--26 to 31 inches; pale brown (10YR 6/3) silty clay loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, very sticky and very plastic; no roots observed; few very fine tubular pores; strongly effervescent; strongly alkaline (pH 8.8); clear smooth boundary.

Ck3--31 to 42 inches; pale brown (10YR 6/3) silty clay, dark grayish brown (10YR 4/2) moist; moderate thin platy structure; hard, friable, very sticky and very plastic; no roots observed; few very fine tubular pores; strongly effervescent; very strongly alkaline (pH 9.2); clear smooth boundary.

2C--42 to 60 inches; grayish brown (10YR 5/2) silty clay loam and silt loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, sticky and plastic; slightly effervescent; strongly alkaline (pH 9.0)

Type location: Washoe County, Nevada; at the north end of Mosquito Lake in Mosquito Valley; about 1,600 feet west and 2,000 feet south of the northeast corner of section 3, T. 45 N., R. 19 E.; (41 degrees, 51 minutes, 07 seconds north latitude and 119 degrees, 50 minutes, 01 second west longitude.)

Range in Characteristics:

Soil moisture: The soil is usually saturated at the surface for very long periods due to water ponding.

Soil temperature: 44 to 47 degrees F.

Reaction: Moderately alkaline to very strongly alkaline.

Control section:

Clay content--30 to 60 percent.

SAR--1 to 5.

Electrical conductivity--0 to 4 millimhos.

A horizon:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Effervescence--Noneffervescent to slightly effervescent.

C and Ck horizons:

Hue--10YR, 5Y or 2.5Y,

Chroma--2 through 4 in the upper part and 1 through 3 in the lower part.

Texture--Silty clay loam or silty clay.

Effervescence--Noneffervescent to strongly effervescent.

2C horizon:

Texture--stratified silty clay loam and silt loam with strata of very fine sandy loam.

Ashcamp Series

The Ashcamp series consists of shallow and very shallow, well drained soils formed in residuum and colluvium from andesitic tuff and pyroclastic rocks. The Ashcamp soils are on plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic, shallow Vitritorrandic Argixerolls

Typical pedon: Ashcamp sandy loam, in map unit 1164, rangeland (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine tubular and few very fine interstitial pores; 15 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt--3 to 7 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; common thin clay films on faces of peds and lining pores; 10 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Cr--7 to 23 inches; very pale brown (10YR 7/3) soft, weathered andesitic tuff, brown (10YR 5/3) moist; breaks into 2 to 6 centimeter thick plates; many roots and some soil in fractures; many thin glass coats in matrix.

Type location: Washoe County, Nevada. About 1,600 feet south and 1,600 feet west of the northeast corner of section 1, T. 42 N., R. 23 E.; (41 degrees, 35 minutes, 10 seconds north latitude and 119 degrees, 19 minutes, 34 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Depth to bedrock: 7 to 14 inches.

Thickness of mollic: 7 to 14 inches.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Control section:

Clay content--12 to 18 percent.

Rock fragments--Less than 15 percent pebbles (tuff fragments).

A horizon:

Value--2 or 3 moist.

Chroma--2 or 3.

Bt horizon:

Hue--10YR or 7.5YR.

Value--2 or 3 moist.

Chroma--2 or 3

Structure--Angular blocky or subangular blocky.

Rock fragments--Less than 15 percent (tuff fragments).

Consistence--Slightly hard or hard dry.

Other features--Many roots are present within bedrock fractures.

Bt--19 to 24 inches; light yellowish brown (10YR 6/4) gravelly sandy clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium and coarse angular blocky structure; very hard, very friable, sticky, plastic; common very fine roots; common very fine tubular pores; common thin and few moderately thick clay films on peds and lining pores; 30 percent pebbles; slightly alkaline (pH 7.4); gradual smooth boundary.

Cr--24 to 60 inches; very pale brown (10YR 7/3) weathered andesitic tuff, brown (10YR 5/3) moist; digs with difficulty; hard, firm; few thin clay films bridging mineral grains near upper boundary; few thin silica coats appearing as glassy luster.

Type location: Washoe County, Nevada in an unsectioned area, about 1,900 feet south and 2,200 feet east of the projected northwest corner of section 5, T. 42 N., R. 19 E.; (41 degrees, 35 minutes, 32 seconds north latitude and 119 degrees, 52 minutes, 45 seconds west longitude.)

Ashdos Series

The Ashdos series consists of moderately deep, well drained soils formed in residuum and colluvium of andesitic tuff and pyroclastic rocks. The Ashdos soils are on plateaus, mountains and hills. Slopes are 4 to 50 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Ashy, frigid Vitritorrandic Argixerolls

Typical pedon: Ashdos very gravelly fine sandy loam, in map unit 1250, rangeland (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; 40 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--2 to 7 inches; brown (10YR 5/3) gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine and common fine roots; common very fine tubular pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A3--7 to 12 inches; brown (10YR 5/3) gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; strong fine and medium subangular blocky structure; hard, very friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and common fine tubular pores; 20 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt1--12 to 19 inches; light yellowish brown (10YR 6/4) gravelly sandy clay loam, dark brown (10YR 4/3) moist; strong fine and medium angular blocky structure; very hard, very friable, sticky, plastic; common very fine, few fine roots; many very fine tubular pores; common thin and few moderately thick clay films on peds and lining pores; 20 percent pebbles; neutral (pH 7.2); gradual smooth boundary.

Range in Characteristics:

Soil moisture: moist in winter and spring; dry from July through October.

Soil temperature: 45 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Thickness of mollic: 8 to 16 inches.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Reaction: neutral or slightly alkaline.

Control section:

Clay content--18 to 25 percent.

Rock fragments--15 to 30 percent, when mixed, mainly pebbles.

A horizons:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4

Structure--Angular blocky or subangular blocky.

Ashone Series

The Ashone series consists of moderately deep, well drained soils formed in residuum and colluvium from andesitic tuff and pyroclastic rocks. The Ashone soils are on plateaus, mountains, and hills. Slopes are 4 to 50 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic Vitritorrandic Argixerolls

Typical pedon: Ashone very gravelly fine sandy loam, in map unit 1250, rangeland (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly fine sandy loam, very dark grayish brown

(10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial and vesicular pores; 50 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

A2--2 to 8 inches; brown (10YR 5/3) gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine and fine, few medium roots; many very fine tubular pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt1--8 to 12 inches; brown (10YR 5/3) gravelly sandy clay loam, dark brown (10YR 3/3) moist; strong fine and medium angular blocky structure; very hard, very friable, sticky, plastic; common very fine, fine and medium roots; common very fine tubular pores; common thin and few moderately thick clay films on peds and lining pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt2--12 to 22 inches; light yellowish brown (10YR 6/4) gravelly sandy clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium and coarse angular blocky structure; very hard, very friable, sticky, plastic; few very fine and few fine roots; few very fine tubular pores; common thin and few moderately thick clay films on peds and lining pores; 30 percent pebbles; slightly alkaline (pH 7.6); gradual smooth boundary.

Cr--22 to 60 inches; very pale brown (10YR 7/3) weathered andesitic tuff, brown (10YR 5/3) moist; digs with difficulty; hard, firm; few very fine and fine roots in pockets.

Type location: Washoe County, Nevada in an unsectioned area, about 2,800 feet east and 3,200 feet south of the projected northwest corner of section 5, T. 42 N., R. 19 E.; (41 degrees, 35 minutes, 19 seconds north latitude and 119 degrees, 52 minutes, 37 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Depth to bedrock: 20 to 40 inches.

Thickness of mollic: 8 to 16 inches.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Reaction: Neutral or slightly alkaline.

Control section:

Clay content--22 to 30 percent.

Rock fragments--15 to 30 percent, when mixed, mainly pebbles.

A horizons:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Structure--Angular blocky or subangular blocky.

Ashtre Series

The Ashtre series consists of moderately deep, well drained soils that formed in residuum and colluvium of andesitic tuff and pyroclastic rocks. The Ashtre soils are on plateau shoulder slopes and side slopes. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Ashy, frigid Vitritorrandic Argixerolls

Typical pedon: Ashtre very gravelly loam, in map unit 1251, rangeland (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine vesicular pores; 2 percent cobbles, 40 percent pebbles; slightly acid (pH 6.4); clear wavy boundary.

A2--2 to 7 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine tubular pores; 10 percent pebbles, 1 percent cobbles; neutral (pH 6.6); clear wavy boundary.

Bt1--7 to 11 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; common very fine and few fine tubular pores; common thin clay films on faces of peds and lining pores; 10 percent pebbles; neutral (pH 6.8); clear wavy boundary.

Bt2--11 to 17 inches; light yellowish brown (10YR 6/4) clay loam, dark brown (10YR 4/3) moist; strong medium subangular blocky structure; very hard, very friable, sticky and plastic; common very fine and few fine and medium roots; many very fine tubular pores; common thin and moderately thick clay films on faces of peds, lining pores and bridging mineral grains; 10 percent pebbles, 1 percent cobbles; neutral (pH 6.8); clear wavy boundary.

Bt3--17 to 26 inches; light brown (7.5YR 6/4) clay loam, strong brown (7.5YR 4/6) moist; moderate medium and coarse subangular blocky structure; very hard, friable, sticky and plastic; common very fine and few fine roots; many very fine and common fine tubular pores; common thin and few moderately thick clay films on faces of peds, lining pores and bridging mineral grains; 10 percent pebbles, 3 percent cobbles; neutral (pH 7.0); abrupt wavy boundary.

Cr--26 to 60 inches; pink (7.5YR 7/4) soft, weathered andesitic tuff, strong brown (7.5YR 5/6) moist; can be dug with difficulty; hard, firm; thin glass coatings of ash over bedrock.

Type location: Washoe County, Nevada. In Little Basin in an unsectioned area, T. 43 N., R. 20 E.; (41 degrees, 40 minutes, 44 seconds north latitude and 119 degrees, 43 minutes, 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 45 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Mollic epipedon: 10 to 16 inches.

Mineralogy: 35 to 60 percent glass in the whole sand fraction throughout.

Reaction: Neutral or slightly acid.

Control section:

Clay content--27 to 35 percent when mixed.

Rock fragments--5 to 15 percent pebbles when mixed.

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Dry value of 6 is only in the surface 3 inches. The surface 7 inches when mixed has a dry value of less than 5.5.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 through 6.

Clay content--20 to 25 percent in the Bt1, 27 to 35 percent in the lower Bt horizons.

Structure--Angular blocky or subangular blocky.

Consistence--Hard or very hard dry, very friable or friable moist.

Rock fragments--5 to 15 percent, mainly pebbles.

Other features--The bedrock is covered with a thin glass coating of ash over bedrock.

faces of peds; 1 percent stones, 5 percent cobbles, 40 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

Cr--15 to 19 inches; soft volcanic rock.

Type location: Washoe County, Nevada; about 0.25 miles northeast of Barrel Springs road; about 1,100 feet west and 1,700 feet south of the northeast corner of section 33, T. 46 N., R. 19 E.; (41 degrees, 52 minutes, 02 seconds north latitude and 119 degrees, 51 minutes, 07 seconds west longitude.)

Range in Characteristics:

Soil temperature: 40 to 42 degrees F.

Average summer soil temperature: 54 to 59 degrees F.

Mollic epipedon thickness: 7 to 15 inches.

Depth to paralithic contact: 14 to 20 inches.

Control section:

Clay content--12 to 18 percent.

Rock fragments--40 to 80 percent.

A horizon:

Value--3 through 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizon:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Clay content--12 to 18 percent.

Consistence--Very friable or friable, slightly sticky or sticky, slightly plastic or plastic.

Badgercamp Series

The Badgercamp series consists of shallow, well drained soils that formed in residuum from soft tuffaceous bedrock. The Badgercamp soils are on summits and shoulders of plateaus. Slopes are 4 to 70 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 40 degrees F.

Taxonomic class: Loamy-skeletal, mixed, shallow Argic Cryoborolls

Typical pedon: Badgercamp bouldery loam, in map unit 1358, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 2 percent boulders, 2 percent cobbles, and 10 percent pebbles.

A1--0 to 5 inches; dark grayish brown (10YR 4/2) bouldery loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine tubular pores; 2 percent boulders, 1 percent cobbles, 5 percent pebbles; neutral (pH 6.8); clear smooth boundary.

Bt--5 to 15 inches; dark grayish brown (10YR 4/2) very gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine tubular pores; few thin clay films on

Bearbutte Series

The Bearbutte series consists of deep, well drained soils that formed in alluvium and colluvium from tuffaceous rocks. The Bearbutte soils are on side slopes of mountains, hills, and plateaus. Slopes are 4 to 15 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Coarse-loamy, mixed, frigid Pachic Argixerolls

Typical pedon: Bearbutte fine sandy loam, in map unit 1020, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; dark grayish brown (10YR 4/2) fine sandy loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine tubular pores; 10 percent pebbles; neutral (pH 6.6); clear smooth boundary.

A2--2 to 9 inches; dark grayish brown (10YR 4/2) fine sandy loam, very dark brown (10YR 2/2) moist; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky and nonplastic, many very fine roots; many very fine tubular pores; 10 percent pebbles; neutral (pH 6.8); clear smooth boundary.

Bt1--9 to 19 inches; brown (10YR 4/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak medium

- subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and medium roots; many very fine tubular pores; few thin clay films on faces of peds; 20 percent pebbles; neutral (pH 6.8); abrupt smooth boundary.
- Bt2--19 to 24 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine and medium roots; many very fine and fine tubular pores; few thin clay films on faces of peds and bridging mineral grains; 30 percent pebbles; neutral (pH 6.8); clear smooth boundary.
- C1--24 to 40 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 4/3) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine, fine and medium roots; many very fine tubular pores; 10 percent pebbles; 5 percent cobbles; neutral (pH 7.0); clear smooth boundary.
- C2--40 to 53 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine tubular pores; 10 percent pebbles, 5 percent cobbles; neutral (pH 7.0); clear wavy boundary.
- Cr--53 to 57 inches; soft weathered tuff.

Type location: Washoe County, Nevada; approximately 0.25 miles north of Forty Nine Summit in an unsectioned area, T. 42 N., R. 19 E.; (41 degrees, 35 minutes, 43 seconds north latitude and 119 degrees, 53 minutes, 12 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through October.

Soil temperature: 42 to 45 degrees.

Mollic epipedon thickness: 20 to 40 inches.

Depth to paralithic contact: 40 to 60 inches.

Control section:

Clay content--10 to 18 percent.

Rock fragments--Averages 5 to 30 percent.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Chroma--2 or 3.

Texture--Sandy loam or loam.

Clay content--10 to 18 percent.

Rock fragments--Averages 5 to 30 percent, mostly pebbles.

Structure--Weak, fine and medium subangular blocky.

Organic matter content--3 to 5 percent

C horizons:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Clay content--3 to 15 percent.

Rock fragments--Averages 15 to 30 percent.

Bidrim Series

Bidrim series are shallow, well drained soils that formed in residuum from basalt, andesite and tuff. The Bidrim soils are on plateau rims. Slopes are 2 to 15 percent. The mean annual precipitation is about 12 inches and the mean annual air temperature is about 45 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic Lithic Argixerolls

Typical pedon: Bidrim extremely stony loam, in map unit 1165, woodland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent stones and boulders, 20 percent cobbles, and 20 percent pebbles.

A1--0 to 1 inch; very dark brown (10YR 2/2) extremely stony loam, black (10YR 2/1) moist; moderate very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; 15 percent stones; 20 percent cobbles; 20 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--1 to 3 inches; dark grayish brown (10YR 4/2) very stony loam, very dark brown (10YR 2/2) moist; moderate very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; 15 percent stones; 20 percent cobbles; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt--3 to 8 inches; brown (7.5YR 4/2) clay loam, dark brown (7.5YR 3/2) moist; moderate fine subangular blocky structure; hard, very friable, very sticky and plastic; many very fine, common fine and few medium roots; common fine tubular pores; many moderately thick clay films on faces of peds and lining pores; vertical cracks 5 millimeters to 16 millimeters wide and 5 to 7 inches apart extend from a depth of 3 to 13 inches; 10 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Btss--8 to 13 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate medium and coarse angular blocky structure; extremely hard, very firm, very sticky and very plastic; common very fine and few fine, medium and coarse roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and lining pores; common slickensides; 10 percent pebbles; neutral (pH 7.0); clear smooth boundary.

R--13 to 17 inches; hard massive vesicular basalt; rounded into stone size; few fractures.

Type location: Washoe County, Nevada; 1.2 miles north of Barrel Springs road and about 400 feet east of power line road; about 200 feet west and 1,600 feet south of the northeast corner of section 11, T. 46 N., R. 18 E.; (41 degrees, 55 minutes, 33 seconds north latitude and 119 degrees, 55 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Thickness of mollic: 7 to 11 inches and includes all or part of the argillic horizon.

Depth to bedrock: 10 to 14 inches

Control section:

Clay content--38 to 45 percent when mixed.

A horizons:

Value--2 through 4 dry, 2 or 3 moist.

Chroma--1 or 2.

Organic matter--6 to 8 percent in the A1 horizon and 3 to 4 percent in the A2 horizon.

Bt horizon:

Hue--10YR or 7.5YR

Value--4 through 5 dry, 2 or 3 moist

Chroma--2 through 4

Clay content--33 to 38 percent.

Rock fragments--5 to 15 percent, mainly pebbles.

Other features--Vertical cracks 5 to 20 millimeters wide.

Btss horizon:

Hue--10YR or 7.5YR.

Value--3 or 4 moist.

Chroma--2 through 4.

Clay content--55 to 65 percent.

Rock fragments--5 to 10 percent, mainly pebbles.

Bieber Series

The Bieber series consists of shallow and very shallow to hardpan, well and moderately well drained soils on fan terraces. Slopes are 2 to 15 percent. Mean annual precipitation is about 12 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Argiduridic Durixerolls

Typical pedon: Bieber very gravelly loam, in map unit 1166, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate very thin and thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; common very fine vesicular pores; 50 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A2--2 to 6 inches; brown (10YR 5/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine roots; many very fine tubular pores; 25 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--6 to 10 inches; brown (10YR 5/3) gravelly clay loam, dark brown (7.5YR 3/2) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 15 percent pebbles; neutral (pH

7.3); abrupt wavy boundary.

Bt2--10 to 13 inches; brown (7.5YR 5/4) gravelly clay, dark brown (7.5YR 3/4) moist; strong fine and medium angular blocky structure; very hard, very friable, very sticky and plastic; common very fine and fine and few medium roots; many very fine tubular pores; 15 percent pebbles; many thin and moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bt3--13 to 16 inches; brown (7.5YR 5/4) gravelly clay, dark brown (7.5YR 3/4) moist; strong medium and coarse angular blocky structure; very hard, friable, very sticky and very plastic; common very fine and few fine roots; many very fine and few fine tubular pores; 20 percent pebbles; many thin and moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.6); abrupt wavy boundary.

2Bqkm1--16 to 22 inches; light brown (7.5YR 6/4) continuous silica laminae capped indurated duripan, brown (7.5YR 5/4) moist; strong medium and thick platy structure; extremely hard, extremely firm; 40 percent cemented pebbles; abrupt smooth boundary.

2Bqkm2--22 to 31 inches; light brown (7.5YR 6/4); indurated and strongly cemented duripan, brown (7.5YR 5/4) moist; massive; extremely hard, very firm; few silica pendants and lime coats on underside of rock fragments; 60 percent rounded pebbles and 10 percent cobbles; clear smooth boundary.

2Bqk--31 to 60 inches; light brown (7.5YR 6/4) stratified cobbly sandy loam to very gravelly sandy loam, brown (7.5YR 5/4) moist; hard and very hard, friable and firm; no roots observed; many very fine interstitial pores; 40 percent rounded pebbles and 10 percent cobbles; common fine lime and silica coats on underside of rock fragments; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; about 700 feet west and 1,900 feet north of the southeast corner section 24, T. 47 N., R. 18 E.; (41 degrees, 58 minutes, 44 seconds north latitude and 119 degrees, 54 minutes, 29 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 50 to 55 degrees F.

Depth to duripan: 8 to 20 inches.

A horizons:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3

Reaction--Slightly acid or neutral

Bt1 horizon:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 2 or 3 moist

Chroma--2 or 3

Clay content--27 to 36 percent

Texture--Clay loam or gravelly clay loam

Rock fragments--10 to 35 percent pebbles

Reaction--Slightly acid or neutral

Bt2 and Bt3 horizons:

Hue--10YR or 7.5YR
 Value--4 through 6 dry, 3 or 4 moist
 Chroma--2 through 4
 Clay content--35 to 45 percent
 Rock fragments--5 to 30 percent pebbles
 Structure--Prismatic or angular blocky
 Reaction--Slightly acid to moderately alkaline

Bighat Series

The Bighat series consists of very deep, well drained soils that formed in mixed alluvium. The Bighat soils are on lake shore terraces and beach terraces. Slopes are 4 to 30 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine-loamy over sandy or sandy-skeletal, mixed, mesic Typic Natrargids

Typical pedon: Bighat very stony sandy loam, in map unit 1210, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 5 percent stones, 20 percent cobbles, and 15 percent pebbles.

A1--0 to 2 inches; light gray (10YR 7/2) very stony sandy loam, dark brown (10YR 4/3) moist; strong thick and very thick platy structure; hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine and fine vesicular pores; 5 percent stones, 20 percent cobbles; 15 percent pebbles; violently effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

A2--2 to 6 inches; white (10YR 8/2) stony loam, yellowish brown (10YR 5/4) moist; strong medium and thick platy structure; hard, very friable, sticky and slightly plastic; common very fine and few fine roots; many very fine vesicular pores; 10 percent stones, 5 percent cobbles, 15 percent pebbles; strongly effervescent; strongly alkaline (pH 8.6); abrupt wavy boundary.

A3--6 to 9 inches; very pale brown (10YR 7/3) and white (10YR 8/2) stony loam, dark yellowish brown (10YR 4/4) moist; strong very thick platy structure; hard, very friable, very sticky and plastic; common very fine and fine roots; many very fine tubular pores; 5 percent stones, 5 percent cobbles, 20 percent pebbles; slightly effervescent; strongly alkaline (pH 8.5); abrupt wavy boundary.

Btn--9 to 16 inches; light yellowish brown (10YR 6/4) stony sandy clay loam, yellowish brown (10YR 5/4) moist; moderate fine and medium prismatic structure parting to strong medium and coarse angular blocky; very hard, friable, sticky and plastic; common very fine, few fine roots; few very fine tubular pores; common thin and moderately thick clay films on faces of peds and lining pores; 10 percent stones, 5 percent cobbles, 15 percent pebbles; slightly effervescent; moderately alkaline (pH 8.0); abrupt wavy boundary.

2Bqk1--16 to 31 inches; brown (10YR 5/3) extremely stony coarse sand, brown (10YR 4/3) moist; massive; hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 25 percent

stones, 15 percent cobbles, 35 percent pebbles; common thin silica coats bridging mineral grains; continuous 0.5 millimeter thick lime and silica coats on underside of rock fragments; 5 percent large soft masses of lime in pockets in soil surrounding some cobbles and some 2 inch pebbles and on sides of stones; few 0.5 to 1.0 millimeter thick discontinuous silica laminae; violently effervescent; strongly alkaline (pH 8.5); gradual wavy boundary.

3Bqk2--31 to 60 inches; brown (10YR 5/3) extremely gravelly coarse sand, brown (10YR 4/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; no roots observed; many very fine interstitial pores; 5 percent stones, 10 percent cobbles, 60 percent pebbles; few thin silica coats bridging mineral grains; common 0.5 millimeter thick lime and silica coats on underside of rock fragments; 2 percent large soft masses of lime in pockets; violently effervescent; strongly alkaline (pH 9.0).

Type location: Washoe County, Nevada. About 10 miles southeast of Cedarville, California; about 3,500 feet south of Bull Creek; about 1,800 feet east and 2,400 feet north of the southwest corner of section 16, T. 41 N., R. 18 E.; (41 degrees, 28 minutes, 24 seconds north latitude and 119 degrees, 58 minutes, 45 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist for brief periods in winter, dry from late May through November. Aridic moisture regime.

Soil temperature: 47 to 53 degrees F.

Depth to sandy or sandy-skeletal layers: 15 to 27 inches.

Control section:

Clay content--upper part averages 25 to 35 percent; the lower part (Bqk horizons) averages 0 to 2 percent.

Rock fragments--20 to 30 percent stones, cobbles and pebbles in the upper part, 60 to 75 percent stones, cobbles and pebbles in the lower part.

A horizons:

Hue--10YR or 2.5Y

Reaction--Moderately alkaline or strongly alkaline

Btn horizon:

Value--6 or 7 dry, 4 or 5 moist

Chroma--3 or 4

Texture--Stony clay loam or stony sandy clay loam

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Slightly effervescent to violently effervescent; few fine and medium soft masses of lime are in some pedons.

SAR--13 to 45 percent

Bqk horizons:

Value--5 through 8 dry, 4 through 6 moist

Chroma--3 or 4

Reaction--Mildly alkaline or moderately alkaline

Bitner Series

The Bitner series consists of moderately deep, well drained soils that formed in residuum and colluvium from tuff breccia and pyroclastic rocks. The Bitner soils are on plateau shoulder slopes. Slopes are 4 to 30 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Ashy, mesic Vitritorrandic Haploxerolls

Typical pedon: Bitner gravelly sandy loam, in map unit 1195, rangeland (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent pebbles, including cinders, obsidian and rhyolitic pebbles.

A1--0 to 2 inches; brown (10YR 5/3) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 20 percent cinders, volcanic glass and rhyolitic pebbles; slightly acid (pH 6.1); clear wavy boundary.

A2--2 to 7 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine interstitial pores; 15 percent cinders and glassy vitric pyroclastic pebbles; slightly acid (pH 6.4); clear wavy boundary.

Bw--7 to 13 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine and medium roots; many very fine tubular and interstitial pores; 15 percent cinders and glassy vitric pyroclastic pebbles; 5 percent rhyolitic pebbles; neutral (pH 7.2); clear wavy boundary.

Bq1--13 to 19 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak coarse subangular blocky structure; slightly hard and hard, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial and common very fine tubular pores; 20 percent cinders and glassy vitric pyroclastic pebbles; 5 percent rhyolitic pebbles; 5 percent 5 to 20 millimeter hard, firm durinodes with few fine strong brown (7.5YR 4/6) iron stains, black (10YR 2/1) moist; 15 percent hard, firm and brittle 2 to 5 centimeter nodules that slake in water; slightly alkaline (pH 7.4); clear wavy boundary.

Bq2--19 to 27 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak medium and coarse subangular blocky structure; slightly hard and hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial and common very fine tubular pores; 25 percent cinders and glassy vitric pyroclastic pebbles; 5 percent rhyolitic pebbles; 5 percent 5 to 20 millimeter hard, firm durinodes with few fine strong brown (7.5YR 4/6) iron stains, black (10YR 2/1) moist; 15 percent hard, firm and brittle 2 to 5 centimeter nodules that

slake in water; slightly alkaline (pH 7.6); abrupt wavy boundary.

Cr--27 to 35 inches; highly weathered and fractured tuff breccia with few fine roots in some fractures; many 1 to 5 millimeter glass and vitric pyroclastic pebbles in matrix; many moderately thick glass coats.

Type location: Washoe County, Nevada. On the east side of Massacre Mountain in an unsectioned area, T. 42 N., R. 22 E.; (41 degrees, 33 minutes, 23 seconds north latitude and 119 degrees, 32 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Depth to bedrock: 20 to 40 inches.

Mollic epipedon: 10 to 20 inches.

Mineralogy: 60 to 80 percent glass in the very fine and fine sand size throughout.

Reaction: Slightly acid or neutral in the upper part, neutral or slightly alkaline in the lower part.

Control section:

Clay content--12 to 18 percent.

Rock fragments--15 to 25 percent pebbles that are dominantly cinders when mixed.

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Dry value of 6 is only in the surface 2 inches of some pedons.

Chroma--2 or 3.

Bw horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Bq horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Other features--2 to 10 percent 2 to 10 centimeter durinodes. Some pedons have 1 to 2 inch thick 2C horizons immediately above the Cr that are extremely gravelly sandy loam.

Blizzard Series

The Blizzard series consists of shallow, well drained soils that formed in colluvium over residuum from basalt and tuff. Blizzard soils are on plateaus. Slopes range from 2 to 15 percent. The mean annual precipitation is about 14 inches and the annual temperature is about 43 degrees F.

Taxonomic class: Clayey, montmorillonitic Argic Lithic Cryoborolls

Typical pedon: Blizzard very cobbly silty clay loam, in

map unit 1296, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with about 1 percent stones, 20 percent cobbles, and 30 percent pebbles.

- A--0 to 2 inches; brown (7.5YR 5/2) very cobbly silty clay loam, brown (7.5YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine, fine, and coarse roots; few very fine vesicular pores; 1 percent stones, 20 percent cobbles, 30 percent pebbles; slightly alkaline (pH 7.6); clear boundary.
- Bt1--2 to 5 inches; brown (7.5YR 5/2) silty clay, dark brown (7.5YR 3/2) moist; strong medium subangular blocky structure; very hard, friable, very sticky and very plastic; common very fine and fine roots; few very fine tubular pores; common thin clay films on faces of peds and in pores; 10 percent cobbles; slightly alkaline (pH 7.4); clear wavy boundary.
- Bt2--5 to 19 inches; brown (7.5YR 5/2) cobbly clay, brown (7.5YR 4/2) moist; strong medium angular blocky structure; extremely hard, firm, very sticky and very plastic; few very fine and fine roots; few very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 20 percent cobbles; slightly alkaline (pH 7.4); abrupt smooth boundary.
- R--19 to 23 inches; slightly fractured basalt.

Type location: Washoe County, Nevada; east of Coleman Valley; about 1,000 feet east and 200 feet south of the northwest corner of section 15 T. 47 N., R. 20 E.; (41 degrees, 59 minutes, 45 seconds north latitude and 119 degrees, 43 minutes, 43 seconds west longitude.)

Range in Characteristics:

Soil moisture: Dry during July to October

Soil temperature: 43 to 47 degrees F.

Average summer soil temperature: 54 to 59 degrees F.

Depth to bedrock: 10 to 20 inches.

Thickness of mollic: 7 to 10 inches and includes part or all of the argillic.

Reaction: Neutral or slightly alkaline

Control section:

Clay content--45 to 60 percent.

Rock fragments--0 to 25 percent, mainly cobbles and pebbles.

A horizon:

Hue--7.5YR or 10YR.

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt horizon:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Silty clay, cobbly clay or clay.

Rock fragments--0 to 20 percent cobbles, 0 to 15 percent pebbles.

Other features--Some pedons have Bk horizons below the Bt.

Boltz Series

The Boltz series consists of moderately deep, well drained soils formed in residuum and colluvium from andesitic tuff and pyroclastic rocks. The Boltz soils are on plateau shoulder slopes and side slopes. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Ashy, frigid Vitritorrandic Haploxerolls

Typical pedon: Boltz gravelly sandy loam, in map unit 1278, rangeland (Colors are for dry soil unless otherwise noted.)

- A1--0 to 3 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine roots; many very fine interstitial pores; 10 percent cinders, 5 percent volcanic glass and rhyolitic pebbles, 1 percent cobbles; slightly acid (pH 6.4); clear wavy boundary.
- A2--3 to 11 inches; brown (7.5YR 5/2) gravelly sandy loam, dark brown (7.5YR 3/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; many very fine tubular pores; 15 percent cinders and glassy vitric pyroclastic pebbles; neutral (pH 6.8); clear wavy boundary.
- Bw--11 to 20 inches; brown (7.5YR 5/4) gravelly sandy loam, dark brown (7.5YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many very fine and common fine tubular pores; 10 percent cinders and 5 percent glassy vitric pyroclastic pebbles; neutral (pH 6.8); clear wavy boundary.
- C--20 to 34 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and few fine and medium roots; many very fine interstitial and common very fine tubular pores; few thin clay films in pockets around some pebbles; 20 percent cinders and glassy vitric pyroclastic pebbles; neutral (pH 7.0); clear wavy boundary.
- Cr--34 to 60 inches; very pale brown (10YR 7/4) soft, weathered pyroclastic tuff, yellowish brown (10YR 5/4) moist; many pyroclastic pumiceous gravel size; many moderately thick glass coats; can be dug with difficulty.

Type location: Washoe County, Nevada. On the east side of Massacre Mountain in an unsectioned area, T. 42 N., R. 22 E.; (41 degrees, 32 minutes, 30 seconds north latitude and 119 degrees, 32 minutes, 27 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July

through October.

Soil temperature: 45 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Mollic epipedon: 10 to 16 inches.

Mineralogy: 60 to 80 percent glass in the very fine and fine sand size throughout.

Reaction: Neutral or slightly acid.

Control section:

Clay content--10 to 18 percent when mixed.

Rock fragments--15 to 25 percent pebbles that are dominantly cinders when mixed.

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Dry value of 6 is only in the surface 2 inches of some pedons.

Chroma--2 or 3.

Bw horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

C horizons:

Chroma--3 or 4

Texture--Sandy loam or loam.

Clay content--10 to 20 percent.

Glass and glass aggregates--60 to 90 percent of the fine earth fraction.

Bombadil Series

The Bombadil series consists of very shallow and shallow, well drained soils that formed in residuum from weathered basic igneous rock. Bombadil soils are on hills, plateaus, and mountains. Slopes are 4 to 30 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic Lithic Xeric Haplargids

Typical pedon: Bombadil very stony loam, in map unit 1060, rangeland. (Colors are for dry soil unless otherwise noted.) The surface is partially covered by 5 percent stones, 10 percent cobbles, 25 percent pebbles.

A--0 to 3 inches; light brownish gray (10YR 6/2) very stony loam, dark brown (10YR 4/3) moist; strong very thin and thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; very few fine roots; many fine vesicular pores; 5 percent stones, 10 percent cobbles and 25 percent pebbles; slightly alkaline (pH 7.4); abrupt smooth boundary.

Bt1--3 to 6 inches; brown (10YR 5/3) loam, dark brown (10YR 4/3) moist; strong very fine and fine subangular blocky; slightly hard, very friable, sticky and plastic; many very fine, fine, medium and coarse roots; many very fine interstitial, and many very fine, fine and medium tubular pores; common thin clay films on faces of peds and in pores; 10 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt2--6 to 14 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; strong fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, fine, medium and coarse roots; many very fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 20 percent pebbles; slightly alkaline (pH 7.8); abrupt wavy boundary.

R--14 to 18 inches; hard basalt; highly fractured in the upper 4 inches with common very fine and fine roots, soil, and discontinuous silica and lime coatings in fractures.

Type location: Washoe County, Nevada; about 10 feet east of the Nevada-California state line and 50 feet south of trail; about 600 feet south and 10 feet east of the northwest corner of section 8, T. 42 N., R. 18 E.; (41 degrees, 34 minutes, 52 seconds north latitude and 119 degrees, 59 minutes, 53 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry in summer and early autumn.

Soil temperature: 47 to 53 degrees F.

Depth to bedrock: 7 to 14 inches.

Reaction: Neutral or slightly alkaline.

Control section:

Percent clay--18 to 27.

Rock fragments--10 to 25 percent.

A horizon:

Hue--10YR, 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt1 horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 or 4 except 2 in the upper part of some pedons.

Texture--Loam or clay loam

Clay content--18 to 35 percent.

Rock fragments--10 to 25 percent by average.

Bt2 horizon:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 4 or 5 moist.

Chroma--3 or 4.

Clay content--25 to 35 percent.

Consistence--Very friable or friable, slightly sticky or sticky, slightly plastic or plastic.

Rock fragments--10 to 20 percent by average.

Boulder Lake Series

The Boulder Lake series consists of very deep, somewhat poorly drained soils that formed in clayey lacustrine sediments derived mainly from tuff, basalt, and andesite. The Boulder Lake soils are on flat interplateau basins, and lake plains. Slopes are 0 to 2 percent. The mean annual

precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Xeric Epiaquepts

Typical pedon: Boulder Lake silty clay, in map unit 1010, rangeland. (Colors are for moist soil unless otherwise noted.)

A--0 to 2 inches; very dark grayish brown (10YR 3/2) silty clay, grayish brown (10YR 5/2) dry; strong very fine and fine granular structure; slightly hard, friable, very sticky and very plastic; few very fine roots; many very fine and fine interstitial pores; vertical cracks 10 to 30 millimeters wide and 3 to 6 inches apart; slightly acid (pH 6.4); abrupt smooth boundary.

Bw--2 to 6 inches; dark grayish brown (10YR 4/2) silty clay, grayish brown (10YR 5/2) dry; moderate medium prismatic structure; slightly hard, friable, very sticky and very plastic; few very fine, fine and medium roots; many very fine and fine interstitial pores; vertical cracks 10 to 30 millimeters wide and about 3 to 6 inches apart; neutral (pH 6.6); abrupt wavy boundary.

Bwss1--6 to 12 inches; dark grayish brown (10YR 4/2) clay, grayish brown (10YR 5/2) dry; moderate coarse prismatic structure parting to strong very fine and fine angular blocky; slightly hard, friable, very sticky and very plastic; many very fine, few fine and medium roots; few very fine and fine tubular pores; vertical cracks 10 to 50 millimeters wide and about 3 to 6 inches apart; few slickensides; neutral (pH 6.6); clear wavy boundary.

Bwss2--12 to 29 inches; dark grayish brown (10YR 4/2) clay, light brownish gray (10YR 6/2) dry; moderate medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; few very fine, fine and medium roots; few very fine tubular pores; vertical cracks 10 to 20 millimeters wide and about 3 to 6 inches apart; common wedge-shaped aggregates tilted 30 degrees from horizontal; common slickensides; few fine and medium distinct brown (7.5YR 4/4) and very dark brown (7.5YR 2/2) iron and manganese masses on faces of peds and in pores; neutral (pH 6.8); gradual smooth boundary.

Bwss3--29 to 60 inches; dark grayish brown (10YR 4/2) clay, light brownish gray (10YR 6/2) dry; weak coarse prismatic structure parting to strong medium to very coarse angular blocky; hard, friable, very sticky and very plastic; few fine and medium roots; few fine tubular pores; common slickensides; common fine distinct brown (7.5YR 4/4) and dark brown (7.5YR 3/4) iron masses on faces of peds and in pores; few fine and medium distinct very dark brown (10YR 2/2) manganese masses on faces of peds; neutral (pH 6.8).

Type location: Washoe County, Nevada; at the south end of Macy Flat; about 1,800 feet west and 1,900 feet north of the southeast corner of Sec. 32, T 47 N., R. 21 E.; (41 degrees, 57 minutes, 00 seconds north latitude and 119 degrees, 38 minutes, 30 seconds west longitude.)

Range in Characteristics:

Soil moisture: Ponded for less than 45 consecutive days in most years, mainly in the spring; brief ponding occurs after intensive rainfall.

Soil temperature: 43 to 47 degrees F.

Average summer soil temperature: 62 to 64 degrees F.

Effervescence: Noncalcareous or slightly effervescent but ranges to strongly effervescent in some pedons where few to common, very fine to medium lime segregations occur below depths of 20 inches.

Other features: Cracks at the surface are up to 3 inches wide and are 3 to 6 inches apart. These decrease in width as depth increases. Cracks remain open for fewer than 180 consecutive days.

A horizon:

Hue--10YR or 2.5Y.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 or 3 moist, 1 through 3 dry.

Reaction--Slightly acid to slightly alkaline.

Bw and Bwss horizon:

Hue--10YR or 2.5Y.

Chroma--2 or 3. (Some pedons have dry chromas of 1 in the upper Bw)

Texture--Clay or silty clay, some pedons have clay loam in the immediate surface layer.

Structure--Moderate or strong, medium to very coarse prismatic and very fine to very coarse angular blocky in the upper part; weak to strong, medium to very coarse prismatic and moderate or strong, medium to very coarse angular in the lower subhorizons.

Consistence--Very hard or extremely hard, dry; firm or very firm, moist; may be slightly hard and friable in subhorizons.

Mottles--Few or common, very fine to medium, distinct or prominent, redoximorphic concentrations with reddish, yellowish and brownish colors.

Reaction--Neutral to moderately alkaline.

Other features--Few to many slickensides and many pressure faces. Soil is interpreted as having reduced matrix colors due to saturation.

Bucklake Series

The Bucklake series consists of moderately deep, well drained soils that formed in material weathered from basalt or andesite. Bucklake soils are on mountain back slopes and escarpments. Slopes range from 15 to 50 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Aridic Argixerolls

Typical pedon: Bucklake very stony loam, in map unit 1081, rangeland. (Colors are for dry soil unless otherwise noted). The surface is covered with 5 percent stones, 20 percent cobbles, and 20 percent gravel.

A1--0 to 3 inches; brown (7.5YR 5/2) very stony loam, dark brown (7.5YR 3/2) moist; weak medium and thick platy structure; hard, very friable, sticky and plastic; many very fine and fine, few coarse roots; many very fine tubular pores; 5 percent stones, 20 percent cobbles, 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A2--3 to 8 inches; brown (7.5YR 5/2) very stony loam, dark brown (7.5YR 3/2) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and fine, few coarse roots; many very fine tubular pores; 10 percent stones, 15 percent cobbles and 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--8 to 12 inches; brown (7.5YR 5/2) gravelly clay loam, dark brown (7.5YR 3/2) moist; moderate medium and coarse subangular blocky structure; hard, very friable, sticky and plastic; common very fine and few fine roots; many very fine tubular pores; common thin and moderately thick clay films on peds; 25 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

Bt2--12 to 18 inches; brown (7.5YR 5/4) gravelly clay, dark brown (7.5YR 3/4) moist; moderate medium and coarse subangular blocky structure; hard, friable, very sticky and very plastic; common very fine roots; many very fine tubular pores; many thin and moderately thick clay films on peds; 25 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

Bt3--18 to 24 inches; brown (7.5YR 5/4) gravelly clay, dark reddish brown (5YR 3/4) moist; weak medium and coarse angular blocky structure; hard, friable, very sticky and very plastic; common very fine roots; many very fine tubular pores; many thin and moderately thick clay films on peds; 25 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

R--24 to 28 inches; hard basalt with some fractures.

Type location: Washoe County, Nevada; about 2,500 feet south and 1,700 feet west of the northeast corner of section 15, T. 43 N., R. 18 E.; (41 degrees, 38 minutes, 53 seconds north latitude and 119 degrees, 57 minutes, 02 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 20 to 40 inches.

Thickness of mollic: 10 to 20 inches and includes part of the Bt horizons.

A horizons:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 2 or 3 moist

Chroma--2 or 3

Bt horizons:

Hue--10YR or 7.5YR dry, 10YR, 7.5YR or 5YR moist

Value--3 or 4 moist

Chroma--2 through 4, moist chroma of 4 is only in Bt2 or Bt3 horizons

Texture--Clay loam in the upper part, clay or clay loam in the lower part

Clay content--27 to 35 percent in the upper part, 35 to 50 percent in the lower part

Rock fragments--5 to 30 percent, mainly pebbles

Reaction--Neutral or slightly alkaline

Buffaran Series

The Buffaran series consists of shallow to a duripan, well drained soils that formed in alluvium derived from mixed rock sources. Buffaran soils are on fan piedmonts, mountain valley fans, and ballenas. Slopes are 2 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Xeric Argidurids

Typical pedon: Buffaran very stony loam, in map unit 1110, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered by approximately 20 percent pebbles, 15 percent cobbles, and 10 percent stones.

A--0 to 2 inches; light brownish gray (10YR 6/2) very stony loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine roots; 10 percent stones, 15 percent cobbles, 20 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bt1--2 to 6 inches; brown (10YR 5/3) gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; few very fine and fine roots; common very fine tubular pores; few thin clay films bridging sand grains; 15 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bt2--6 to 10 inches; pale brown (10YR 6/3) clay loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; common very fine and few fine roots; common very fine tubular pores; common thin clay films on faces of peds and bridging sand grains; 10 percent pebbles; neutral (pH 7.3) clear wavy boundary.

Bt3--10 to 14 inches; light yellowish brown (10YR 6/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate very fine and fine angular blocky; slightly hard, very friable, sticky and plastic; common very fine and few fine roots; common very fine tubular pores; many moderately thick clay films on faces of peds; 15 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bq--14 to 16 inches; light yellowish brown (10YR 6/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, very friable, sticky and plastic; few very fine and fine roots; common very fine tubular pores; 25 percent 1 to 4 centimeter pieces of strongly silica-cemented duripan; slightly alkaline (pH 7.5); abrupt wavy boundary.

Bqm--16 to 27 inches; indurated duripan; massive; extremely hard, extremely firm; alternate strong

cementation and indurated silica laminae; 60 percent pebbles.

Bqkm--27 to 60 inches; light gray (10YR 7/2) strongly cemented duripan consisting of many thin laminae with weakly cemented material between the laminae; 30 percent pebbles, 30 percent cobbles; violently effervescent; moderately alkaline (pH 8.2).

Type location: Washoe County, Nevada; northwest of Rye Creek Reservoir; about 900 feet west and 1,000 feet north of the southeast corner of section 36, T. 47 N., R. 21 E.; (41 degrees, 56 minutes, 51 seconds north latitude and 119 degrees, 33 minutes, 38 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 52 degrees F.

Depth to duripan: 14 to 20 inches.

A horizon:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 3 or 4 moist, (after mixing 7 inches value greater than 5.5 dry)

Chroma--2 or 3

Reaction--Neutral to moderately alkaline.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 through 6.

Texture--Clay or clay loam (35 to 50 percent clay).

Structure--Subangular blocky or granular.

Consistence--Slightly hard or hard dry, very friable or friable moist, slightly plastic or plastic wet.

Rock fragments--5 to 40 percent, mainly pebbles.

Reaction--Neutral to moderately alkaline.

Bq horizon:

Texture--Loam or clay loam.

Consistence--Slightly hard or hard dry, very friable or friable or firm moist, slightly sticky to sticky and slightly plastic to plastic, wet.

Rock fragments--20 to 40 percent strongly cemented duripan fragments.

Reaction--Neutral to moderately alkaline

Effervescence--Noneffervescent to strongly effervescent.

Ceejay Series

The Ceejay series consists of shallow, well drained soils that formed in residuum weathered from basalt. Ceejay soils are on plateaus. Slopes are 4 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic Lithic Xeric Haplargids

Typical pedon: Ceejay stony loam, in map unit 1400, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with approximately 2 percent stones, 10 percent cobbles, and 40 percent pebbles.

A1--0 to 4 inches; light brownish gray (10YR 6/2) stony loam, dark grayish brown (10YR 4/2) moist; moderate medium platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine vesicular and common very fine tubular pores; 2 percent stones, 5 percent cobbles, 35 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A2--4 to 6 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; moderate medium platy structure; slightly hard, very friable, slightly sticky and nonplastic; common very fine and fine roots; common fine tubular and interstitial pores; 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--6 to 10 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine prismatic structure parting to strong angular blocky; hard, friable, very sticky and very plastic; few very fine and fine roots; common very fine tubular pores; many moderately thick clay films on faces of peds; 5 percent cobbles; 20 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt2--10 to 15 inches; brown (7.5YR 5/4) gravelly clay loam, brown (7.5YR 4/4) moist; moderate fine prismatic structure parting to moderate fine angular blocky; hard, friable, very sticky and very plastic; few very fine and fine roots; common very fine tubular pores; common moderately thick clay films on faces of peds; 15 percent pebbles, 5 percent cobbles; neutral (pH 7.0); abrupt irregular boundary.

R--15 to 19 inches; hard basalt, fractured in some areas. Thin lime and silica coatings in rock fractures.

Type location: Washoe County, Nevada in an unsectioned area, T. 41 N., R. 23 E.; (41 degrees, 25 minutes, 58 seconds north latitude, and 119 degrees, 21 minutes, 05 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, dry in the summer and fall, moist in winter and spring.

Soil temperature: Averages 54 to 59 degrees F.

Depth to bedrock: 14 to 20 inches.

Reaction: Neutral to moderately alkaline.

Control section:

Clay content--35 to 45 percent.

Rock fragments--Averages 15 to 30 percent, mainly pebbles and cobbles.

A horizon:

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 or 5 moist or dry.

Chroma--3 or 4 moist or dry.
 Texture--Clay loam, or clay.
 Clay content--35 to 45 percent.
 Rock fragments--Averages 15 to 30 percent, mainly pebbles and cobbles.
 Structure--Prismatic parting to platy or angular blocky.
 Consistence--Slightly hard to extremely hard, sticky or very sticky and plastic or very plastic.
 Other features--Lime coatings may be absent on bedrock in some pedons.

Chime Series

The Chime series are moderately deep, well drained soils that formed in residuum from tuffaceous sandstone. Chime soils are on side slopes of upland plateaus and fan piedmont remnants with a rock core. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Durinodic Xeric Haplargids

Typical pedon: Chime gravelly loam, in map unit 1235, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; moderate thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; common fine and very fine vesicular pores; 20 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--3 to 7 inches; light gray (10YR 7/2) gravelly loam, brown (10YR 4/3) moist; moderate medium platy structure; hard, very friable, slightly sticky and slightly plastic; few medium, fine, and very fine roots; few fine and very fine vesicular pores; 20 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bt--7 to 16 inches; pale brown (10YR 6/3) clay loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; hard, firm, sticky and plastic; few fine and very fine roots; common very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 10 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bq--16 to 25 inches; very pale brown (10YR 8/3) gravelly loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; hard, firm, sticky and plastic; few fine and very fine roots; few fine tubular pores; 60 percent discontinuous silica cementation; 20 percent pebbles; continuous brittle matrix; slightly alkaline (pH 7.8); abrupt wavy boundary.

Cr--25 to 29 inches; weathered tuffaceous sandstone.

Type location: Washoe County, Nevada; about 2,300 feet east and 1,700 feet south of the northwest corner of section 28 T. 42 N., R. 18 E.; (41 degrees, 32 minutes, 04 seconds north latitude and 119 degrees, 58 minutes, 39 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid June through October.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 20 to 30 inches.

Depth to Bq horizon: 14 to 20 inches.

Control section:

Clay content--27 to 35 percent.

Rock fragments--Up to 20 percent, mainly pebbles.

A horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Bt horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry.

Chroma--3 or 4.

Structure--Moderate or strong, fine to coarse angular or subangular blocky.

Total thickness--9 to 12 inches.

Bq horizon:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 4 or 5 moist.

Texture--Loam, gravelly loam, clay loam, gravelly clay loam.

Rock fragments--5 to 20 percent, mainly pebbles.

Cementation--Continuous brittle matrix and some pedons contain 20 to 60 percent discontinuous silica cementation.

Corral Series

The Corral series consists of shallow, well drained soils that formed in material weathered from tuffaceous sandstone or diatomaceous earth. Corral soils are on terrace pediments or plateau escarpments. Slopes are 4 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic, shallow Xeric Haplargids

Typical pedon: Corral very stony loam, in map unit 1095, rangeland. (Colors are for dry soil unless otherwise stated). The soil surface is partially covered with 10 percent stones, 15 percent cobbles, and 20 percent pebbles.

A1--0 to 3 inches; pale brown (10YR 6/3) very stony loam, very dark grayish brown (10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine vesicular pores; 10 percent stones, 15 percent cobbles and 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A2--3 to 7 inches; brown (10YR 5/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine

and medium subangular blocky structure; hard, very friable, sticky and plastic; common very fine roots; many very fine interstitial and common very fine tubular pores; 15 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt--7 to 16 inches; yellowish brown (10YR 5/4) sandy clay loam, dark brown (10YR 4/3) moist; strong very fine and medium subangular blocky; hard, very friable, sticky and plastic; common very fine, fine and medium roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.4); abrupt wavy boundary.

Cr--16 to 20 inches; soft tuffaceous sandstone; common fine and medium roots are along cracks and fractures. Common thin and moderately thick clay films in the upper part along fractures.

Type location: Washoe County, Nevada; about 600 feet north and 600 feet west of the southeast corner of section 26, T. 43 N., R. 18 E.; (41 degrees, 36 minutes, 47 seconds north latitude and 119 degrees, 55 minutes, 41 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry mid June through October.

Soil temperature: 47 to 53 degrees F.

Depth to paralithic: 12 to 20 inches.

A horizons:

Value--5 or 6 dry, 3 or 4 moist.
Chroma--2 or 3.

Bt horizon:

Hue--10YR or 7.5YR.
Value--4 through 6 dry.
Texture--Loam, sandy clay loam or clay loam
Sand content--20 to 50 percent
Reaction--Neutral or slightly alkaline
Rock fragments--0 to 15 percent, mainly pebbles
Structure--Prismatic, angular blocky or subangular blocky.

Cotant Series

The Cotant series consists of shallow, well drained soils that formed in residuum and colluvium from welded tuffs, tuff, rhyolite and mixed sedimentary rocks. Cotant soils are on crests and sideslopes of hills, mountains, and rock pediment remnants. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid, shallow Aridic Argixerolls

Typical pedon: Cotant very gravelly loam, in map unit 1375, rangeland. (Colors are for dry soil unless

otherwise noted.) The soil surface is partially covered with 40 percent pebbles and 5 percent cobbles.

A--0 to 2 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots; many very fine interstitial and vesicular pores; 40 percent pebbles and 5 percent cobbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt1--2 to 9 inches; dark grayish brown (10YR 4/2) clay, very dark brown (10YR 2/2) moist; strong very fine subangular blocky structure; hard, friable, very sticky and very plastic; common medium and fine roots; common fine and very fine tubular pores; many moderately thick clay films on faces of peds and lining pores; 10 percent pebbles; common thin pale brown (10YR 6/3) uncoated sand grains on horizontal faces of peds, dark brown (10YR 3/3) moist; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bt2--9 to 14 inches; dark grayish brown (10YR 4/2) clay, very dark grayish brown (10YR 3/2) moist; strong fine and medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; common fine and medium roots concentrated along vertical faces of peds; common medium and fine tubular pores; 10 percent pebbles; many moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.8); clear wavy boundary.

Bt3--14 to 19 inches; light yellowish brown (10YR 6/4) clay, dark yellowish brown (10YR 4/4) moist and brown (10YR 5/3) expd, dark brown (10YR 4/3) moist; strong medium prismatic structure parting to strong medium and coarse angular blocky; hard, friable, very sticky and very plastic; common fine and medium roots; common very fine tubular pores; 10 percent pebbles; 10 percent brown (10YR 4/3) clay films, very dark grayish brown (10YR 3/2) moist on faces of peds and in pores; slightly alkaline (pH 7.8); clear smooth boundary.

Cr--19 to 23 inches; very pale brown (10YR 7/4) weathered tuff, dark yellowish brown (10YR 4/4) moist; few medium and fine roots along weak fracture planes; common moderately thick clay films in upper 2 inches; 5 percent hard pebbles in matrix; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; about 600 feet west and 900 feet north of the southeast corner of section 13, T. 43 N., R. 18 E.; (41 degrees, 38 minutes, 35 seconds north latitude, and 119 degrees, 54 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist; moist in winter and spring, dry July through October. Aridic Xeric soil moisture regime.

Soil temperature: 42 to 47 degrees F.

Mollic epipedon thickness: 7 to 14 inches, including all or part of argillic horizon.

Depth to paralithic contact: 12 to 20 inches.

Profile reaction: Neutral or slightly alkaline.

A horizon:

Value--5 or 6 dry (5.5 or darker after mixing the surface 7 inches)

Chroma--2 or 3.

Value--5 or 6 dry (5.5 or darker after mixing the surface 7 inches.)

Bt horizons:

Value--4 through 6 dry, 3 through 5 moist. The upper subhorizon is 4 or 5 dry and 3 moist.

Chroma--2 through 4, with 4 only in the lower subhorizons.

Texture--Clay, some pedons have clay loam subhorizons.

Clay content--40 to 60 percent.

Rock fragments--0 to 15 percent, mainly pebbles and cobbles; up to 25 percent common in some subhorizons.

Structure--Prismatic, angular blocky or subangular blocky.

Consistence--Very friable to firm, moist; sticky or very sticky and plastic or very plastic, wet.

Btss1--5 to 10 inches; dark brown (7.5YR 4/2) clay, dark brown (7.5YR 3/2) moist; strong fine and medium angular blocky structure; very hard, very friable, very sticky and very plastic; common very fine and few fine, medium and coarse roots; common very fine tubular pores; many thin and common moderately thick and thick clay films on faces of peds and lining pores; vertical cracks 2 to 5 millimeters wide and 4 to 6 inches apart extend from 5 to 14 inches; common slickensides; 10 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

Btss2--10 to 14 inches; brown (7.5YR 5/4), and dark brown (10YR 3/3) expd clay, dark brown (7.5YR 4/4) and (10YR 3/3) on exteriors of peds, moist; strong medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; common very fine and fine roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and lining pores; common slickensides; 10 percent pebbles; neutral (pH 7.0); abrupt irregular boundary.

R--14 to 18 inches; hard massive vesicular basalt; rounded into stone size; few fractures.

Crocen Series

Crocen series consist of shallow, well drained soils that formed in residuum from basalt, andesite and tuff. The Crocen soils are on plateau rims. Slopes are 2 to 15 percent. The mean annual precipitation is about 14 inches and the mean annual air temperature is about 43 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid Lithic Argixerolls

Typical pedon: Crocen extremely stony loam, in map unit 1186, woodland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 15 percent stones and boulders, 15 percent cobbles, and 20 percent pebbles.

A1--0 to 1 inch; very dark brown (10YR 2/2) extremely stony loam, black (10YR 2/1) moist; moderate very fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; 15 percent stones and boulders; 15 percent cobbles; 20 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--1 to 3 inches; very dark grayish brown (10YR 3/2) very cobbly loam, very dark brown (10YR 2/2) moist; moderate very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 10 percent stones; 15 percent cobbles; 20 percent pebbles; neutral (pH 6.8); clear wavy boundary.

Bt--3 to 5 inches; very dark grayish brown (10YR 3/2) clay loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and fine and common medium roots; common fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 10 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Type location: Washoe County, Nevada; South of Barrel Springs road along power line; about 1,700 feet west and 2,000 feet north of the southeast corner of section 31, T. 46 N., R. 19 E.; (41 degrees, 51 minutes, 47 seconds north latitude and 119 degrees, 53 minutes, 33 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 44 to 47 degrees F.

Thickness of mollic: 7 to 14 inches and includes all or part of the argillic horizon.

Depth to bedrock: 10 to 14 inches

Control section:

Rock fragments--10 to 35 percent.

Clay content--38 to 45 percent when mixed.

A horizons:

Value--2 or 3 dry, 2 or 3 moist.

Chroma--1 or 2.

Organic matter --8 to 10 percent in the A1, 3 to 4 percent in the A2.

Bt and Btss1 horizons:

Hue--10YR or 7.5YR

Value--3 or 4 dry, 2 or 3 moist

Clay content--33 to 38 percent.

Rock fragments--5 to 15 percent, mainly pebbles.

Btss2 horizon:

Hue--10YR or 7.5YR.

Value--3 through 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Clay content--50 to 65 percent.

Rock fragments--5 to 10 percent, mainly pebbles.

Other features--Vertical cracks 5 to 10 millimeters wide; none to common slickensides.

Davey Series

The Davey series consists of very deep, somewhat excessively drained soils that formed in alluvium from mixed rock sources. Davey soils are on sand sheets, alluvial fans, lagoons, lake plain terraces and fan skirts. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Sandy, mixed, mesic Xeric Haplocambids

Typical pedon: Davey loamy fine sand, in map unit 1205, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 6 inches; light brownish gray (10YR 6/2) loamy fine sand, very dark grayish brown (10YR 3/2) moist; weak very thin platy structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; neutral (pH 7.3); clear wavy boundary.

Bw--6 to 16 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; neutral (pH 7.3); clear wavy boundary.

C--16 to 30 inches; pale brown (10YR 6/3) loamy fine sand, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; moderately alkaline (pH 7.9); clear wavy boundary.

Ck1--30 to 41 inches; pale brown (10YR 6/3) loamy fine sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; slightly effervescent; lime is disseminated; slightly effervescent; lime is disseminated; moderately alkaline (pH 7.9); clear wavy boundary.

Ck2--41 to 60 inches; pale brown (10YR 6/3) fine sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; slightly effervescent; lime is disseminated; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; about 3 miles north of Road 8A and 3.5 miles northwest of Painted Point in an unsectioned area. (41 degrees, 37 minutes, 39 seconds north latitude and 119 degrees, 44 minutes, 57 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring; dry May through October.

Soil temperature: 47 to 53 degrees F.

Thickness of A and Bw horizons: 11 to 23 inches.

Depth to lime: 0 to 30 inches.

Control section:

Clay content--5 to 10 percent.

Rock fragments--Up to 30 percent in any one horizon but average is less than 15 percent.

Gypsum: Gypsum crystals are below a depth of 20 inches in some pedons.

A horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry (greater than 5.5 when the surface 7 inches are mixed), 3 through 6 moist.

Chroma--1 through 3.

Reaction--Neutral or slightly alkaline.

Bw horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Fine sandy loam or sandy loam, some pedons have subhorizons that are gravelly sandy loam.

Structure--Prismatic, subangular blocky or it is massive.

Reaction--Neutral to moderately alkaline.

C and Ck horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Fine sand, loamy fine sand, loamy sand, but thin strata of fine sandy loam or coarse sand are in some pedons.

Reaction--Slightly alkaline to strongly alkaline.

Effervescence--Slightly effervescent to violently effervescent in the Ck horizon. Segregated lime occur as few or common filaments or as partial coats on rock fragments, or lime is disseminated.

Deseed Series

The Deseed series consists of moderately deep, well drained soils that formed in residuum and colluvium from rhyolite, tuff and basalt. Deseed soils are on plateaus side slopes. Slopes are 2 to 15 percent. Mean annual precipitation is 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Xeric Haplargids

Typical pedon: Deseed silt loam, in map unit 1163, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; moderate thick platy structure; soft, very friable, slightly sticky and slightly plastic; few fine and very fine roots; common very fine vesicular pores; 10 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt1--3 to 9 inches; pale brown (10YR 6/3) clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, firm, sticky and plastic; few fine and very fine roots; few fine tubular pores; few thin clay films on faces of peds and lining pores; 10 percent pebbles; neutral (pH 7.0); clear smooth boundary.

- Bt2--9 to 17 inches; light yellowish brown (10YR 6/4) gravelly clay, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; few very fine roots; few fine tubular pores; common moderately thick clay films on faces of peds; 25 percent pebbles, 5 percent cobbles; neutral (pH 7.0); clear smooth boundary.
- Bt3--17 to 25 inches; brown (10YR 5/3) gravelly clay, yellowish brown (10YR 5/4) moist; strong medium subangular blocky structure; very hard, very firm, very sticky and very plastic; few very fine roots; few fine and very fine tubular pores; many moderately thick clay films on faces of peds; 20 percent pebbles, 5 percent cobbles; neutral (pH 7.2); abrupt smooth boundary.
- C--25 to 28 inches; light yellowish brown (10YR 6/4) gravelly loam, yellowish brown (10YR 5/4) moist; massive; hard, friable, sticky and plastic; few very fine roots; few very fine tubular pores; 5 percent cobbles, 20 percent pebbles; slightly alkaline (pH 7.5); abrupt irregular boundary.
- R--28 to 32 inches; hard basalt.

Type location: Washoe County, Nevada; about 2.5 miles west of Coleman Valley near the Nevada-Oregon state line; about 1,450 feet east and 400 feet south of the northwest corner of section 14, T. 47 N., R. 19 E.; (41 degrees, 59 minutes, 48 seconds north latitude and 119 degrees, 49 minutes, 23 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry late June through October.

Soil temperature: 44 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Control section:

Clay content--Average 35 to 45 percent.

Rock fragments--5 to 35 percent, mainly pebbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3 moist or dry.

Bt1 horizon:

Clay content--30 to 35 percent.

Texture--Silty clay loam or clay loam.

Reaction--Neutral or slightly alkaline.

Bt2, Bt3 horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 4 or 5 moist.

Chroma--3 through 6.

Structure--Weak to strong, medium or coarse angular or subangular blocky, or weak prismatic.

Texture--Gravelly clay, gravelly clay loam, clay or clay loam.

Clay content--35 to 50 percent.

Reaction--Neutral or slightly alkaline.

C horizons:

Hue--10YR.

Value--6 through 8 dry, 5 through 7 moist.

Chroma--2 or 4.

Texture--Cobbly loam or gravelly loam.

Reaction--Slightly alkaline or moderately alkaline.

Devada Series

The Devada series consists of shallow, well drained soils that formed in residuum weathered dominantly from volcanic rock with additions of loess and volcanic ash. Devada soils are on footslopes, sideslopes, shoulders, ridges and summits of plateaus, mountains and hills. Slopes are 2 to 50 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic Lithic Argixerolls

Typical pedon: Devada very cobbly loam, in map unit 1325, rangeland. (Colors are for dry soil, unless otherwise stated.) The soil surface is partially covered with 30 percent cobbles and 20 percent pebbles.

- A1--0 to 2 inches; grayish brown (10YR 5/2) very cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine interstitial pores; 30 percent cobbles and 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.
- A2--2 to 6 inches; brown (10YR 5/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and common fine roots; many very fine interstitial pores; 30 percent pebbles, 20 percent cobbles; neutral (pH 7.0); abrupt smooth boundary.
- Bt1--6 to 11 inches; brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; hard, very friable, very sticky and plastic; few fine roots; very few fine tubular pores; common moderately thick clay films on faces of peds and in pores; neutral (pH 7.0); clear wavy boundary.
- Bt2--11 to 17 inches; yellowish brown (10YR 5/4) gravelly clay, dark brown (10YR 4/3) moist; strong medium and coarse angular blocky structure; hard, friable, very sticky and very plastic; few fine roots; few fine tubular pores; many moderately thick clay films on faces of peds and in pores; 15 percent pebbles; neutral (pH 7.3); abrupt irregular boundary.
- R--17 to 21 inches; hard basalt; few fractures in upper 1 inch; few fine and medium roots in fractures; common thin silica coats on underside of fractured pieces; dark yellowish brown (10YR 4/4) clay, very dark brown (10YR 2/2) moist; weathered in place in some fractures.

Type location: Washoe County, Nevada; about 1 mile northwest of Vya; about 1,800 feet west and 2,000 feet north of the southeast corner of section 32, T. 43 N., R. 19 E.; (41 degrees, 36 minutes, 11 seconds north latitude and 119 degrees, 52 minutes, 29 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 53 degrees.

Mollic epipedon: 7 to 20 inches thick, includes all or part of the argillic horizon.

Combined thickness of A and Bt horizons: 12 to 20 inches.

Depth to bedrock: 12 to 20 inches.

Control section:

Clay content--40 to 60 percent.

Rock fragments--0 to 30 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist. Some pedons have a thin surface layer with value of 6 dry, but when the upper 7 inches are mixed, value is less than 5.5 dry.

Chroma--2 or 3.

Reaction--Slightly acid to slightly alkaline.

Bt horizons:

Hue--5YR, 7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Dominantly clay or gravelly clay, commonly with thin subhorizons of clay loam.

Structure--Prismatic, angular blocky, subangular blocky. Consistence--Slightly hard to very hard, dry; sticky to very sticky, wet.

Reaction--Neutral or slightly alkaline.

Other features--Some pedons have thin silica coats on peds and rock fragments in the lower part of the Bt horizon.

Devoy Series

The Devoy series consist of moderately deep well drained soils that formed in residuum from volcanic rock. Devoy soils are on plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 13 inches, and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic Argic Cryoborolls

Typical pedon: Devoy cobbly loam, in map unit 1295, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with about 15 percent cobbles and 15 percent pebbles.

A1--0 to 5 inches; grayish brown (10YR 5/2) cobbly loam, dark brown (10YR 3/3) moist; weak very fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and few fine roots; many very fine and fine vesicular pores; 15 percent cobbles; 15 percent pebbles; neutral (pH 7.2); clear smooth boundary.

A2--5 to 10 inches; grayish brown (10YR 5/2) very cobbly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, fine and medium roots; many very fine and fine tubular pores;

20 percent cobbles; 20 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A/B--10 to 17 inches; light yellowish brown (10YR 6/4) very cobbly clay loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; hard, friable, sticky and plastic; few very fine and fine roots; many very fine and fine tubular pores; 20 percent cobbles; 20 percent pebbles; neutral (pH 6.8); clear wavy boundary.

Bt--17 to 30 inches; yellowish brown (10YR 5/4) very cobbly clay, dark yellowish brown (10YR 4/4) moist; strong coarse angular blocky structure; very hard, friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; 20 percent cobbles; 20 percent pebbles; common moderately thick clay film on faces of peds and in pores; neutral (pH 6.8); abrupt wavy boundary.

R--30 to 34 inches; hard basalt.

Type location: Washoe County, Nevada; east of Coleman Valley; about 2,900 feet east and 300 feet south of the northwest corner of section 15, T. 47 N., R. 20 E.; (41 degrees, 59 minutes, 44 seconds north latitude and 119 degrees, 43 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Dry during July to October in most years.

Soil temperature: 44 to 47 degrees F.

Mean summer temperature: 57 to 59 degrees F.

Depth to bedrock: 20 to 40 inches.

Control section:

Rock fragment--35 to 60 percent.

Clay content--35 to 60 percent

Reaction--Slightly acid or neutral.

A horizons:

Value--2 or 3 moist, 4 or 5 dry.

Chroma--1 through 3.

Consistence--Soft to slightly hard.

Other features--9 to 16 inches thick with thickness increasing with elevation. A/B, B/A, or thin weak E horizons occur in some pedons.

Bt horizon:

Hue 10YR or 7.5YR

Value--4 through 6 dry, 3 through 5 moist,

Chroma--3 or 4.

Texture--Sandy clay, clay or clay loam

Rock fragment--35 to 60 percent.

Structure--Angular blocky or prismatic.

Other features--Thin zones of carbonate accumulation occur below 36 inches and overlie bedrock in some pedons.

Dosie Series

The Dosie series consists of deep, well drained soils that formed in residuum and colluvium weathered from basalt. The Dosie soils are on plateau and mountain side slopes. Slopes are 15 to 50 percent. The mean annual

precipitation is about 13 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, mesic Pachic Argixerolls

Typical pedon: Dosie very stony loam, in map unit 1365, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent stones, 10 percent cobbles, and 30 percent pebbles.

A1--0 to 2 inches; brown (10YR 5/3) very stony loam, dark brown (10YR 3/3) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine roots; common very fine tubular pores; 10 percent stones, 10 percent cobbles, 30 percent pebbles; neutral (pH 7.0); clear smooth boundary.

A2--2 to 6 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; 45 percent pebbles, 15 percent cobbles; neutral (pH 7.0); clear wavy boundary.

Bt1--6 to 13 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (7.5YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 40 percent pebbles, 10 percent cobbles; neutral (pH 6.6); clear wavy boundary.

Bt2--13 to 22 inches; brown (7.5YR 5/2) very gravelly clay, dark brown (7.5YR 3/2) moist; strong fine and medium subangular blocky structure; hard, very friable, very sticky and very plastic; few very fine, fine and medium roots; common very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 25 percent pebbles, 10 percent cobbles; neutral (pH 6.8); clear wavy boundary.

Bt3--22 to 33 inches; brown (7.5YR 4/4) very gravelly clay, dark brown (7.5YR 3/2) moist; moderate coarse subangular blocky structure; hard, very friable, very sticky and very plastic; few very fine and fine roots; common very fine and fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; 50 percent pebbles; neutral (pH 6.8); clear wavy boundary.

Bt4--33 to 42 inches; brown (7.5YR 4/4) extremely gravelly clay, dark reddish brown (5YR 3/3) moist; strong very fine and fine angular blocky structure; hard, friable, very sticky and very plastic; few very fine and fine roots; few fine tubular pores; continuous moderately thick pressure faces; 50 percent pebbles, 15 percent cobbles; neutral (pH 7.2).

R--42 to 46 inches; hard basalt; weathered in a few pocket.

Type location: Washoe County, Nevada; west of Long Valley; about 1,300 feet north and 1,700 feet east of the southeast corner of section 19, T. 44 N., R. 19 E.; (41 degrees, 42 minutes, 57 seconds north latitude and 119 degrees, 53 minutes, 35 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter, spring and late fall, dry in summer, early and mid fall.

Soil temperature: Averages 47 to 53 degrees F.

Mollic epipedon thickness: 20 to 30 inches, includes upper part of Bt horizons. Organic carbon is less than 1 percent below this depth.

Depth to bedrock: 40 to 60 inches.

Control section:

Clay content--Averages 35 to 50 percent, Bt1 horizon: Typically has less than 35 percent.

Effervescence--Noneffervescent throughout.

Texture--Clay loam, or clay.

Rock fragments--35 to 60 percent average.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Reaction--Slightly acid or neutral.

Bt horizons:

Hue--10YR, 7.5YR, or 5YR.

Value--3 or 4, moist and dry.

Chroma--2 through 4 moist and dry.

Texture--Clay loam, or clay.

Clay content--35 to 50 percent average.

Rock fragments--35 to 65 percent in any subhorizon.

Structure--Subangular blocky or angular blocky.

Dugway Series

The Dugway series consists of moderately deep, moderately well drained soils that formed in mixed lacustrine sediments influenced by volcanic ash. The Dugway soils are on remnant lake terraces. Slopes are 0 to 2 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Natraxeralfic Natridurids

Typical pedon: Dugway fine sandy loam, in map unit 1320, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine vesicular pores; moderately alkaline (pH 8.0); abrupt wavy boundary.

A2--2 to 5 inches; light brownish gray (10YR 6/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, slightly sticky, slightly plastic; many very fine, common very fine roots; many very fine vesicular and interstitial pores; moderately alkaline (pH 8.0); abrupt wavy boundary.

Btn--5 to 11 inches; pale brown (10YR 6/3) clay, dark brown (10YR 3/3) moist; strong fine and medium

prismatic structure; very hard, firm, very sticky, very plastic; many very fine and common fine roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; common thin light gray (10YR 7/2) bleached sand grains on prism tops, brown (10YR 5/3) moist; strongly alkaline (pH 8.6); clear wavy boundary.

Btk--11 to 18 inches; pale yellow (2.5Y 7/4) silty clay loam, olive brown (2.5Y 4/4) moist; moderate very fine and fine prismatic structure parting to strong very fine and fine angular blocky; hard, friable, sticky, plastic; many very fine, common fine and few medium roots; common very fine tubular pores; common thin and moderately thick clay films on faces of peds and lining pores; few fine soft masses of lime; strongly alkaline (pH 8.6); clear wavy boundary.

Bqk1-18 to 25 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 4/3) moist; strong very fine and fine angular blocky structure; hard, friable, sticky, plastic; many very fine roots; many very fine tubular pores; common thin silica coats bridging mineral grains; 30 percent discontinuous weak silica and lime cementation; common fine soft masses of lime; strongly effervescent; strongly alkaline (pH 9.0); clear wavy boundary.

Bqk2--25 to 35 inches; light gray (2.5Y 7/2) silt loam, light olive brown (2.5Y 5/4) moist; strong thin and medium platy structure; hard and very hard, friable and firm, sticky, plastic; common very fine roots; common very fine tubular pores; 60 percent discontinuous weak silica and lime cementation; common thin silica coats bridging mineral grains and lining pores; common fine soft masses of lime; strongly effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

Bqkm--35 to 52 inches; pale yellow (2.5Y 7/3) continuous strongly cemented duripan, brown (10YR 5/3) moist; strong thin and medium platy structure; very hard, very firm, brittle; very common very fine and fine roots in horizontal root mat at upper boundary; few very fine tubular pores; few fine soft masses of lime; noneffervescent matrix; strongly alkaline (pH 9.0); abrupt smooth boundary.

2C--52 to 61 inches; light gray (2.5Y 7/2) stratified silt loam and silty clay loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, sticky, plastic; no roots observed; few very fine tubular pores; slightly effervescent; strongly alkaline (pH 9.0).

Type location: Washoe County, Nevada. About 2,000 feet west, 900 feet south of the northeast corner of section 33, T. 43 N., R. 19 E.; (41 degrees, 36 minutes, 33 seconds north latitude and 119 degrees, 51 minutes, 21 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October. These soils have a seasonal water table at depth between 5 and 6 feet.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 20 to 40 inches.

Depth to carbonates: 11 to 24 inches.

Control section:

Clay content--35 to 50 percent.

A horizons:

Value--6 or 7 dry.

Chroma--2 or 3.

Btk horizons:

Value--5 through 7 dry; 3 through 5 moist.

Chroma--2 through 4.

Clay content--35 to 50 percent

Texture--Silty clay loam, silty clay, clay.

SAR--13 to 45.

Effervescence--Noneffervescent to strongly effervescent in the upper part; slightly effervescent to violently effervescent in the lower part.

Reaction--Moderately alkaline or strongly alkaline.

Bqk horizon:

Value--6 through 8 dry; 4 or 5 moist.

Chroma--2 through 4.

Clay Content--20 to 30 percent.

Texture--Loam, silt loam, silty clay loam.

Structure--Platy, angular blocky or subangular blocky.

Consistence--Hard or very hard dry, very friable to firm moist.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Strongly effervescent or violently effervescent; few or common fine soft masses of lime.

Cementation--20 to 70 percent weak discontinuous silica cementation.

Other features--Few or common silica coats bridging mineral grains.

Bqkm horizon:

Cementation--Continuous strong silica cemented duripan.

2C horizon:

Texture--Usually stratified; dominantly silt loam, silty clay loam, but includes strata of loam, clay loam or fine sandy loam.

Structure--Platy or is massive.

Consistence--Hard or very hard dry, very friable to very firm moist.

Easte Series

The Easte series consists of deep, well drained soils that formed in material weathered from basalt, andesite and volcanic ash. Easte soils are on mountains. Slopes range from 15 to 70 percent. Mean annual precipitation is about 18 inches, and the mean annual temperature is about 44 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Pachic Xerumbrepts

Typical pedon: Easte very gravelly sandy loam, in map unit 1355, forested. (Colors are for dry soil unless otherwise noted).

Oi--2 inches to 0; fresh and decomposing fir needles, twigs and sticks; abrupt smooth boundary.

A1--0 to 5 inches; brown (10YR 5/3) very gravelly sandy loam, very dark brown (10YR 2/2) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine tubular pores; 10 percent cobbles and 40 percent pebbles; slightly acid (pH 6.3); clear wavy boundary.

A2--5 to 10 inches; brown (10YR 4/3) very gravelly sandy loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine and medium roots; many very fine tubular pores; 10 percent cobbles, 40 percent pebbles; slightly acid (pH 6.3); clear wavy boundary.

Bw1--10 to 13 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, medium and coarse roots; many very fine tubular pores; 5 percent cobbles, 40 percent pebbles; medium acid (pH 5.6); clear wavy boundary.

Bw2--13 to 20 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and medium and few coarse roots; many very fine and fine tubular pores; 5 percent cobbles, 50 percent pebbles; medium acid (pH 5.6); clear irregular boundary.

Bw3--20 to 42 inches; brown (10YR 5/3) extremely gravelly loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine and few medium roots; many very fine and fine tubular pores; 5 percent cobbles, 60 percent pebbles; medium acid (pH 5.6); abrupt irregular boundary.

Cr--42 to 52 inches; soft weathered andesitic tuff.

Type location: Washoe County, Nevada; about 100 feet west and 800 feet north of the southeast corner of section 28, T. 47 N., R. 19 E.; (41 degrees, 57 minutes, 41 seconds north latitude and 119 degrees, 50 minutes, 52 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry in late summer and fall.

Soil temperature: 42 to 46 degrees F.

Thickness of umbric: 20 to 40 inches.

Depth to paralithic: 40 to 60 inches.

Control section:

Clay content--8 to 18 percent

Rock fragments--60 to 75 percent

Base saturation--35 to 50 percent to a depth of 20 to 40 inches and up to 65 percent below this depth

A horizons:

Hue--10YR or 7.5YR.

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Reaction--Medium acid or slightly acid.

Bw horizons:

Value--4 or 5 dry.

Chroma--2 or 3.

Reaction--Slightly acid to strongly acid.

Rock fragments--40 to 70 percent, mainly pebbles.

Emagert Series

The Emagert series consists of very deep, moderately well drained soils that formed in alluvium from volcanic rocks and pyroclastic materials. Emagert soils are on stream terraces. Slopes are 0 to 2 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic Vitricollanic Haploxerolls

Typical pedon: Emagert loam, in map unit 1450, rangeland (Colors are for dry soil unless otherwise noted).

A1--0 to 2 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; common very fine interstitial pores; neutral (pH 6.6); clear smooth boundary.

A2--2 to 14 inches; gray (10YR 5/1) loam, very dark brown (10YR 2/2) moist; moderate coarse prismatic parting to moderate medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine and medium roots; common very fine interstitial pores; slightly alkaline (pH 7.6); clear wavy boundary.

A3--14 to 24 inches; dark gray (10YR 4/1) finely stratified loam, black (10YR 2/1) moist; weak medium and coarse prismatic parting to moderate medium platy structure; hard, very friable, sticky and plastic; common very fine through coarse roots; many very fine and fine tubular pores; few fine distinct dark yellowish brown (10YR 3/4) moist, relict redox masses; slightly alkaline (pH 7.6); clear wavy boundary.

A4--24 to 38 inches; gray (10YR 5/1) finely stratified loam, very dark gray (10YR 3/1) moist; moderate fine and medium prismatic parting to moderate medium angular blocky structure; very hard, friable, sticky and plastic; few very fine through coarse roots; common very fine and fine tubular pores; few fine and medium distinct dark yellowish brown (10YR 3/4) moist, relict redox masses; slightly alkaline (pH 7.4); clear wavy boundary.

2C--38 to 48 inches; gray (10YR 6/1) silty clay loam, dark gray (10YR 4/1) moist; moderate fine and medium prismatic parting to moderate medium angular blocky structure; very hard, firm, very sticky and plastic; few very fine through coarse roots; common very fine and fine tubular pores; few fine distinct dark yellowish brown (10YR 3/4) moist, relict redox masses; neutral (pH 7.3); abrupt wavy boundary.

3Ab--48 to 60 inches; gray (5Y 5/1) finely stratified loam, very dark gray (5Y 3/1) moist; moderate fine and medium prismatic parting to moderate medium angular blocky structure; very hard, firm, sticky and plastic; few

very fine through coarse roots; common very fine and fine tubular pores; few fine distinct dark yellowish brown (10YR 3/4) moist, and black (N 2/) moist, redox masses; neutral (pH 7.2).

Type location: Washoe County, Nevada; about 2 miles southeast of Stevens Camp; about 1.4 miles south of the Area of Critical Environmental Concern boundary; about 400 feet east and 100 feet south of the northwest corner of section 13, T. 41 N., R. 22 E.; (41 degrees, 28 minutes, 27 seconds north latitude and 119 degrees, 27 minutes, 29 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October; saturated below 5 feet during late winter and early spring.

Soil temperature: 47 to 50 degrees F.

Thickness of mollic epipedon: 24 to 48 inches, organic matter decreases irregularly with depth.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Control section:

Clay content--18 to 27 percent.

Texture--Dominantly stratified loam and sandy clay loam with stratified textures of sandy loam to silty clay loam in some pedons.

Rock fragments--Less than 10 percent.

A horizons:

Hue--10YR or 2.5Y.

Value--4 or 5 dry, 2 or 3 moist.

Chroma--0 through 2.

Structure--Weak to moderate fine through coarse prismatic parting to platy or blocky.

Reaction--Neutral or slightly alkaline.

Redox features--Relic redox features are present in most pedons.

C horizon:

Hue--10YR, 2.5Y or 5Y.

Value--6 through 8 dry, 4 or 5 moist.

Chroma--1 or 2.

Structure--Weak or moderate fine to medium prismatic parting to platy or blocky, or is massive.

Texture--Usually stratified gravelly loamy sand to silty clay loam. Dominantly loam or sandy clay loam when mixed.

Esmod Series

The Esmod series consists of shallow to duripan, well drained soils that formed in alluvium derived from volcanic rocks. The Esmod soils are on alluvial fans and remnant fan piedmont summits. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Abruptic Xeric Argidurids.

Typical pedon: Esmod very gravelly fine sandy loam, in map unit 1431, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with approximately 50 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; strong medium and thick platy structure; hard, very friable, nonsticky and nonplastic; very fine roots; many very fine and fine vesicular pores; 40 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

A2--2 to 6 inches; pale brown (10YR 6/3) gravelly sandy loam, dark brown (10YR 3/3) moist; strong very thin and thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; neutral (pH 7.2); abrupt wavy boundary.

Bt--6 to 15 inches; light brown (7.5YR 6/4) gravelly clay, dark brown (7.5YR 4/4) moist; strong fine and medium subangular blocky structure; very hard, very friable, very sticky and very plastic; common very fine, few fine and medium roots; common fine tubular pores; common thin and moderately thick clay films on faces of peds and lining pores; 15 percent pebbles; slightly alkaline (pH 7.8); abrupt wavy boundary.

Bqm--15 to 21 inches; pink (7.5YR 8/4) strongly silica cemented duripan, strong brown (7.5YR 5/6) moist; strong medium and thick platy structure; extremely hard, extremely firm; common very fine roots matted on plate surfaces; alternate horizontal light brown (7.5YR 6/4) 1 to 2 millimeter thick silica laminae on tops of plates, dark brown (7.5YR 4/4) moist; moderately alkaline (pH 8.0); clear smooth boundary.

Bqkm1--21 to 28 inches; pink (7.5YR 8/4) continuous strongly silica and lime cemented duripan, strong brown (7.5YR 5/6) moist; moderate thick and very thick platy structure; extremely hard, extremely firm; many fine and medium horizontal masses of lime; many less than 0.5 millimeter lime and silica coats on underside of pebbles; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Bqkm2--28 to 36 inches; very pale brown (10YR 7/4) strongly and weakly silica and lime cemented duripan, dark yellowish brown (10YR 4/6) moist; weak medium and thick platy structure; very hard, extremely firm and very firm; alternate horizontal discontinuous 0.5 to 2 millimeter silica laminae; common fine and medium horizontal lime masses; strongly effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Bqkm3--36 to 60 inches; very pale brown (10YR 8/3) weakly and strongly silica and lime cemented duripan, brown (7.5YR 5/4) moist; massive; very hard, very firm; common less than 0.5 millimeter discontinuous silica laminae; many 1 to 5 millimeter horizontal soft lime masses; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; near the Sheldon Antelope Refuge in an unsectioned area, T. 43 N., R. 22 E.; (41 degrees, 38 minutes, 03 seconds

north latitude and 119 degrees, 28 minutes, 44 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry mid-June through October. Aridic bordering on Xeric moisture regime.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 14 to 20 inches.

Control section:

Clay content--40 to 50 percent.

Rock fragments--Less than 20 percent, mainly pebbles.

Other features--A clay increase of 15 to 25 percent occurs within a distance of 1 inch between the A and Bt horizons.

A horizons:

Value--5 through 7 dry, 2 or 3 moist.

Reaction--Neutral or slightly alkaline.

Chroma--2 or 3.

Bt horizon:

Hue--5YR, 7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Reaction--Neutral or slightly alkaline.

Chroma--3 through 6.

Texture--Clay or gravelly clay.

Rock fragments--Less than 20 percent, dominantly pebble-sized.

Structure--Subangular blocky, angular blocky or prismatic parting to subangular or angular blocky.

Bqm horizons:

Hue--7.5YR or 10YR.

Value--6 through 8 dry, 4 or 5 moist.

Chroma--4 through 6.

Fernpoint Series

The Fernpoint series consists of very deep, well drained soils formed in mixed alluvium. The Fernpoint soils are on lake shore terraces. Slopes are 8 to 30 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Aridic Argixerolls

Typical pedon: Fernpoint very gravelly sandy loam, in map unit 1385, rangeland (Colors for dry soil unless otherwise noted).

A1--0 to 2 inches; pale brown (10YR 6/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; moderate very thin and thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine vesicular and interstitial pores; 50 percent pebbles; neutral (pH 7.3); clear wavy boundary.

A2--2 to 7 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak very fine subangular

blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; common very fine tubular and interstitial pores; 30 percent pebbles; neutral (pH 7.3); clear wavy boundary.

Bt1--7 to 13 inches; brown (10YR 5/3) gravelly sandy clay loam; dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; common thin clay films on faces of peds and lining pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt2--13 to 17 inches; pale brown (10YR 6/3) gravelly sandy clay loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; common thin clay films on faces of peds and lining pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

C1--17 to 23 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; massive; hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine and fine tubular pores; few thin clay films bridging mineral grains; 25 percent pebbles; 1 percent cobbles; slightly alkaline (pH 7.8); clear wavy boundary.

2C1--23 to 32 inches; light yellowish brown (10YR 6/4) extremely gravelly sand, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine roots; many very fine interstitial pores; 50 percent pebbles; 10 percent cobbles; slightly alkaline (pH 7.8); gradual wavy boundary.

2C2--32 to 48 inches; light yellowish brown (10YR 6/4) extremely gravelly sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 50 percent pebbles; 20 percent cobbles; 1 percent stones; slightly alkaline (pH 7.8); gradual wavy boundary.

2C3--48 to 60 inches; variegated colored stratified extremely gravelly sand and extremely cobbly sand; single grain; loose; few very fine roots; many very fine and fine interstitial pores; 50 percent pebbles; 20 percent cobbles; 5 percent stones; about 10 percent of rock fragments have 10 percent less than 0.5 millimeter thick lime coats on underside; noneffervescent matrix; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada. About 7.5 miles northeast of Vya; about 1 mile east of Nevada Route 34 in an unsectioned area, T. 43 N., R. 20 E.; (41 degrees, 40 minutes, 55 seconds north latitude and 119 degrees, 46 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Thickness of mollic: 10 to 16 inches; includes part or all

of Bt horizon

Depth to contrasting layers: 20 to 30 inches

Depth to carbonates: 40 to 50 inches

Control section:

Clay content--18 to 25 percent

Rock fragments--15 to 35 percent pebbles

A horizons:

Value--5 or 6 dry; 3 or 4 moist. Value of 6 only in upper 2 inches

Chroma--2 or 3

Bt horizons:

Value--5 or 6 dry; 3 or 4 moist

Chroma--2 or 3

Reaction--Neutral or slightly alkaline

C horizons:

Textures--stratified extremely gravelly or extremely cobbly sand, coarse sand with strata of loamy sand, loamy coarse sand. Some pedons have strata of extremely stony sand

Reaction--Slightly alkaline or moderately alkaline

Effervescence--Noneffervescent or slightly effervescent matrix; few or common less than 0.5 millimeter thick lime coats on underside of rock fragments

Ferver Series

Ferver series consists of moderately deep to duripan, well drained soils formed in alluvium from basalt and andesite. The Ferver soils are on interplateau alluvial fans. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Very-fine, montmorillonitic, mesic Vertic Argidurids.

Typical pedon: Ferver very gravelly loam, in map unit 1175, rangeland (Colors are for dry soil unless otherwise noted.) The soil surface is covered with about 45 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; strong very thin and thin platy structure; hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and fine and common medium vesicular pores; 1 percent cobbles and 45 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

A2--2 to 5 inches; light brownish gray (10YR 6/2) silt loam, dark brown (10YR 3/3) moist; strong very thick and thick platy structure; very hard, very friable, sticky and plastic; common very fine roots; many very fine and fine vesicular pores; 5 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Btss1--5 to 15 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; strong medium and coarse prismatic

structure; extremely hard, very firm, very sticky and very plastic; common very fine and fine and few medium and coarse horizontal roots; few very fine tubular pores; many moderately thick clay films on faces of peds and lining pores; vertical cracks 8 millimeters to 1 centimeter wide and 3 to 4 inches apart extend from a depth of 5 to 15 inches; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 10 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Btss2--15 to 22 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/3) moist; strong fine and medium prismatic structure parting to strong very fine and fine angular blocky; very hard, firm, very sticky and very plastic; common very fine and few fine roots; common very fine tubular pores; many thin and moderately thick clay films on faces of ped and lining pores; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 10 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Btk--22 to 28 inches; pale brown (10YR 6/3) clay, dark brown (10YR 4/3) moist; moderate fine and medium prismatic structure parting to strong fine and medium angular blocky; very hard, friable, very sticky and very plastic; common very fine roots; common very fine tubular pores; common thin and moderately thick clay films on faces of ped and lining pores; 10 percent pebbles; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; few fine soft masses of lime; moderately alkaline (pH 8.0); gradual wavy boundary.

Bqk--28 to 35 inches; light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium prismatic structure parting to strong fine and medium angular blocky; hard, friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; common thin and few moderately thick silica coats bridging mineral grains; 10 percent pebbles; 5 percent 10 to 20 millimeter hard, firm durinodes; 5 percent medium and large vertical soft masses of lime along prism faces; 30 percent weak discontinuous silica cementation; moderately alkaline (pH 8.2); abrupt wavy boundary.

Bqkm--35 to 46 inches; light yellowish brown (10YR 6/4) continuous strongly silica and lime cemented duripan yellowish brown (10YR 5/4) moist; strong thin and medium platy structure; extremely hard, extremely firm; alternate medium horizontal plates with 1 to 2 millimeter discontinuous horizontal silica laminae on top of plates; horizontal root mat at upper boundary with many very fine, fine, and few medium roots; violently effervescent lime coats on underside of some plates; gradual wavy boundary.

Cr--46 to 53 inches; weathered fractured basalt with silica and lime in fractures.

Type location: Washoe County, Nevada. About 0.75 miles east of the Nevada-California state line and 0.4 miles north of the Barrel Springs Road; about 100 feet west and 2,100 feet north of the southeast corner of section 20, T. 46 N., R. 18 E.; (41 degrees, 53 minutes, 32 seconds north latitude and 119 degrees, 59 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October. Xeric-Andic moisture regime.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 20 to 40 inches

Depth to bedrock: 40 to 60 inches

Control section:

Clay content--60 to 70 percent

Rock fragments--Less than 15 percent, mainly pebbles

A horizons:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3

Reaction--Neutral or slightly alkaline

Btss and Btk horizons:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 4 or 5 moist

Chroma--3 or 4

Clay content--60 to 70 percent in the upper part; 55 to 65 percent in the lower part; when mixed, 60 to 70 percent.

Rock fragments--10 to 15 percent.

Consistence--Very hard through extremely hard dry, friable through very firm moist.

Effervescence--Noneffervescent or slightly effervescent in the lower part; few fine or medium soft masses of lime in the lower part.

Other features: Vertical cracks 5 to 30 millimeters wide, few to common slickensides and wedge-shaped aggregates. A clay increase of 35 to 45 percent occurs within a vertical distance of 1 inch between the A and Bt horizons.

Bqk horizon:

Value--6 or 7 dry, 3 through 5 moist.

Chroma--3 or 4

Effervescence--Noneffervescent or slightly effervescent; few to many fine to large soft masses of lime.

Other--20 to 50 percent weak discontinuous silica cementation; 5 to 10 percent 5 to 15 millimeter durinodes.

Bqkm horizon:

Value--6 through 8 dry, 4 through 6 moist.

Chroma--3 or 4.

Cementation--Strongly cemented or moderately cemented

mesic Typic Argixerolls

Typical pedon: Fiddler very stony loam, in map unit 1081. Western juniper woodland. (Colors are for dry soil unless otherwise stated). The surface is partially covered with 10 percent stones, 15 percent cobbles, and 20 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) very stony loam, very dark brown (10YR 2/2) moist; moderate very fine and fine subangular blocky structure; soft, friable, sticky and plastic; many very fine and fine roots; common very fine tubular pores; 10 percent stones, 15 percent cobbles and 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A2--2 to 7 inches; dark grayish brown (10YR 4/2) very stony loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine and fine and common medium roots; common very fine tubular pores; 20 percent stones, 15 percent cobbles and 10 percent pebbles; neutral (pH 7.0); gradual wavy boundary.

Bt1--7 to 11 inches; brown (7.5YR 5/2) very stony clay loam, dark brown (7.5YR 3/2) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, fine, medium and coarse roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; 20 percent stones, 15 percent cobbles, 15 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt2--11 to 20 inches; brown (7.5YR 5/4) very stony clay, dark brown (7.5YR 4/4) moist; strong fine and medium subangular blocky structure; very hard, friable, very sticky and very plastic; many very fine, common fine and medium and few coarse roots; few very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; 25 percent stones, 10 percent cobbles, 15 percent pebbles; neutral (pH 6.8); gradual wavy boundary.

Bt3--20 to 28 inches; strong brown (7.5YR 5/6) very stony clay, brown (7.5YR 4/4) moist; moderate medium and coarse angular blocky structure; very hard, friable, very sticky and very plastic; common very fine and few fine and medium roots; few very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; 20 percent stones, 10 percent cobbles, 10 percent pebbles; slightly acid (pH 6.5); clear irregular boundary.

R--28 to 32 inches; dark gray (N 4/0) hard fractured basalt.

Type location: Washoe County, Nevada; about 2 miles north of Barrel Springs road; about 2,300 feet east and 2,000 feet south of the northeast corner of section 31, T. 47 N., R. 19 E.; (41 degrees, 57 minutes, 14 seconds north latitude and 119 degrees, 53 minutes, 41 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry late summer and fall.

Soil temperature: 50 to 56 degrees F.

Thickness of mollic: 8 to 20 inches.

Fiddler Series

The Fiddler series consists of moderately deep, well drained soils that formed in residuum weathered from extrusive igneous rock. Fiddler soils are on hills and mountains. Slopes range from 15 to 50 percent. The annual precipitation is about 14 inches and the annual temperature is about 50 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic,

Depth to bedrock: 20 to 40 inches
Reaction: Slightly acid or neutral

A horizons:

Hue--10YR or 7.5YR
 Value--4 or 5 dry, 2 or 3 moist
 Chroma--2 or 3
 Clay content--18 to 27 percent

Bt horizons:

Hue--10YR or 7.5YR
 Value--4 or 5 dry, 3 or 4 moist
 Chroma--2 through 6
 Texture--Very stony clay loam, very cobbly clay loam or very stony clay
 Clay content--35 to 55 percent
 Rock fragments--35 to 55 percent, mainly stones and cobbles

Fitzwater Series

The Fitzwater series consists of very deep, well drained soils that formed in colluvium and residuum from basalt and tuff. Fitzwater soils are on plateau side slopes. Slopes are 30 to 50 percent. The mean annual precipitation is about 14 inches and the annual temperature is about 45 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Haploxerolls

Typical pedon: Fitzwater extremely stony loam, in map unit 1265, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with about 15 percent stones, 20 percent cobbles, and 20 percent pebbles.

A1--0 to 4 inches; grayish brown (10YR 5/2) extremely stony loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots; many very fine vesicular pores; 15 percent stones, 20 percent cobbles, and 20 percent pebbles; neutral (pH 6.6); clear smooth boundary.

A2--4 to 10 inches; grayish brown (10YR 5/2) extremely stony loam, very dark grayish brown (10YR 3/2) moist; moderate medium and fine subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine tubular pores; 20 percent stones, 30 percent cobbles and 15 percent pebbles; neutral (pH 6.6); clear smooth boundary.

2Bw--10 to 19 inches; brown (7.5YR 5/4) extremely cobbly clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; 5 percent stones, 45 percent cobbles and 25 percent pebbles; neutral (pH 7.0); clear wavy boundary.

2C--19 to 60 inches; pale brown (10YR 6/3) extremely cobbly loam, brown (10YR 4/3) moist; massive; slightly hard, firm, sticky and plastic; few very fine roots;

common very fine tubular pores; 20 percent stones, 45 percent cobbles, and 25 percent pebbles; neutral (pH 7.0).

Type location: Washoe County, Nevada; east of Coleman Valley near the Nevada-Oregon state line; about 4,700 feet west and 400 feet south of the northeast corner of section 16, T. 47 N., R. 20 E.; (41 degrees, 59 minutes, 44 seconds north latitude and 119 degrees, 44 minutes, 57 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon: 7 to 12 inches thick.

Control section:

Clay content--18 to 25 percent.

Rock fragments--60 to 90 percent, mainly cobbles and stones.

Sand content--30 to 50 percent.

A horizons:

Value--3 through 5 dry, 2 or 3 moist.

2Bw horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Texture--Loam or clay loam.

Rock fragments--5 to 10 percent stones, 30 to 50 percent cobbles, and 20 to 30 percent pebbles.

2C horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry.

Chroma--3 or 4.

Rock fragments--10 to 40 percent stones, 30 to 50 percent cobbles, and 15 to 30 percent pebbles.

Frentera Series

The Frentera series consists of moderately deep, well drained soils that formed in colluvium weathered from volcanic rocks and ash. Frentera soils are on side slopes of hills and plateaus. Slopes are 15 to 30 percent. The mean annual precipitation is 11 inches and the mean annual temperature is 44 degrees F.

Taxonomic class: Ashy, frigid Vitritorrandic Haploxerolls

Typical pedon: Frentera gravelly sandy loam, in map unit 1245, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent pyroclastic pebbles.

A1--0 to 2 inches; brown (10YR 5/3) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many

very fine interstitial pores; 30 percent pebbles; neutral (pH 6.6); clear wavy boundary.

A2--2 to 9 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine, common medium and few coarse roots; many very fine tubular pores; 15 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bw1--9 to 16 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; soft, very friable and nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine tubular pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bw2--16 to 22 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark brown (10YR 4/3) moist; moderate coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine interstitial pores; 25 percent pebbles; neutral (pH 7.0); abrupt irregular boundary.

R--22 to 26 inches; brownish yellow (10YR 6/6) hard tuff, yellowish brown (10YR 5/6) moist.

Type location: Washoe County, Nevada in an unsectioned area, T. 42 N., R. 22 E.; (41 degrees, 35 minutes, 21 seconds north latitude and 119 degrees, 32 minutes, 48 seconds west longitude.)

Range in Characteristics:

Soil moisture: usually moist in winter and spring; dry June through October. They are warmer than 41 degrees F. from April 15 to November 1, and they are dry within this period after July 1.

Soil temperature: 44 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Mollic epipedon: 10 to 20 inches thick.

Volcanic ash: 30 to 60 percent volcanic ash.

Reaction: Neutral in the upper part and neutral to moderately alkaline in the lower part.

Control section:

Clay content 12 to 18 percent

Rock fragments--15 to 35 percent.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bw horizons:

Value--4 through 6 dry, 3 or 4 moist.

Structure--Weak to moderate subangular blocky structure.

Texture--Loam and sandy loam.

Rock fragments--15 to 35 percent.

Freznik Series

The Freznik series consist of moderately deep, moderately well drained soils that formed in residuum from tuff and basalt. Freznik soils are on plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Xeric Paleargids

Typical pedon: Freznik very stony loam, in map unit 1105, rangeland. (Colors are for dry soil unless otherwise noted.) The surface is covered with about 10 percent stones, 15 percent cobbles, and 20 percent pebbles.

A--0 to 3 inches; pale brown (10YR 6/3) very stony loam, dark brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, very friable, sticky and plastic; many very fine and common fine roots; many very fine vesicular pores; 10 percent stones; 15 percent cobbles; 20 percent pebbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

Bt1--3 to 9 inches; yellowish brown (10YR 5/4) gravelly clay, dark brown (10YR 4/3) moist; weak fine and medium prismatic structure parting to strong fine and medium subangular blocky; very hard, firm, very sticky and very plastic; common very fine and fine and few medium roots; few very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; many pressure faces on faces of peds; 20 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--9 to 15 inches; yellowish brown (10YR 5/4) clay, dark brown (10YR 4/3) moist; moderate medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; common very fine and fine roots; few very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; many pressure faces of peds; 5 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt3--15 to 23 inches; light yellowish brown (10YR 6/4) clay, dark yellowish brown (10YR 4/4) moist; moderate medium and coarse angular blocky structure; hard, very friable, very sticky and very plastic; few very fine, fine and medium roots; few very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; many pressure faces on faces of peds; 10 percent pebbles; moderately alkaline (pH 8.0); abrupt wavy boundary.

R--23 to 27 inches; hard basalt with few thin silica and lime coats in some fractures.

Type location: Washoe County Nevada; about 6 miles north of Barrel Springs Road along power line; about 1,600 feet east and 300 feet south of the northwest

corner of section 15 and the Nevada-Oregon state line, T. 47 N., R. 18 E.; (41 degrees, 59 minutes, 45 seconds north latitude and 119 degrees, 57 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 47 degrees F.

Depth to bedrock: 20 to 40 inches.

Other features: A clay increase of 15 to 25 percent occurs within a vertical distance of 1 inch between the A and Bt horizon.

Control section:

Clay content--40 to 60 percent.

Rock fragments--0 to 15 percent, mainly pebbles.

A horizon:

Value--4 through 6 dry, 3 or 4 moist.

Chroma--1 through 3.

Reaction--Slightly alkaline or moderately alkaline.

Bt horizons:

Hue--7.5YR or 10YR.

Value--4 through 6 dry, 3 through 5 moist.

Chroma--3 through 6.

Structure--Prismatic, angular blocky or subangular blocky in the upper part and blocky or massive in the lower part.

Reaction--Slightly alkaline or moderately alkaline, increasing with depth.

Effervescence--Noneffervescent in the upper part and noneffervescent or slightly effervescent in the lower part. Some pedons have a BCt horizon 2 to 7 inches thick. It is clay loam or clay with 30 to 45 percent clay.

Fulstone Series

The Fulstone series consists of shallow over duripan, well drained soils that formed in alluvium from mixed rocks. Fulstone soils are on fan piedmonts remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 51 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Abruptic Xeric Argidurids

Typical pedon: Fulstone very gravelly sandy loam, in map unit 1410, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 5 percent cobbles and 40 percent pebbles.

A--0 to 4 inches; light brownish gray (10YR 6/2 very gravelly sandy loam, dark grayish brown (10YR 4/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; few very fine and fine roots; common fine and very fine interstitial

and tubular pores; 5 percent cobbles, 40 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.
Bt1--4 to 10 inches; brown (7.5YR 5/4) clay, brown (7.5YR 4/4) moist; strong medium prismatic structure parting to strong fine and medium angular blocky; very hard, firm, very sticky and very plastic; common fine and very fine roots; few fine and very fine tubular pores; continuous pressure faces; neutral (pH 7.0); clear wavy boundary.

Bt2--10 to 16 inches; brown (7.5YR 5/4) clay, brown (7.5YR 4/4) moist; moderate medium prismatic structure parting to strong fine angular blocky; hard, firm, very sticky and very plastic; few fine and very fine roots; few fine and very fine tubular pores; many moderately thick clay films on faces of peds and in pores; neutral (pH 7.0); abrupt wavy boundary.

Bqkm--16 to 26 inches; light yellowish brown (10YR 6/4) indurated duripan, brown (10YR 4/3) moist; very thick platy structure; extremely hard, extremely firm; root mat on surface; strongly effervescent; slightly alkaline (pH 7.6); gradual wavy boundary.

2Bqk--26 to 60 inches; light gray (10YR 7/2) very cobbly sandy loam, brown (10YR 5/3) moist; massive; slightly hard; friable; nonsticky and nonplastic; 40 percent thin to thick weakly silica-lime cemented horizontal layers and masses; 20 percent cobbles, 30 percent pebbles; strongly effervescent; slightly alkaline (pH 7.8).

Type location: Washoe County, Nevada; about 0.6 miles northeast of Stevens Camp; about 2,200 feet north and 300 feet west of the southeast corner of section 3, T. 41 N., R. 22 E.; (41 degrees, 29 minutes, 42 seconds north latitude and 119 degrees, 28 minutes, 47 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from June through October.

Soil temperature: 47 to 53 degrees F.

Depth to indurated duripan: 14 to 20 inches.

Other features: Some pedons have a thin Bt3 horizon with clay or clay loam textures.

Control section:

Clay content--45 to 60 percent.

Rock fragments--0 to 15 percent with individual horizon ranging up to 20 percent.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--1 through 3.

Reaction--Slightly acid to slightly alkaline.

Bt horizons:

Hue--7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 6.

Structure--Prismatic, angular blocky or subangular blocky.

Clay content--45 to 60 percent.

Rock fragments--Usually free of rock fragments, but some pedons average up to 20 percent pebbles or cobbles due to mixing by burrowing animals.

Reaction--Neutral to moderately alkaline.

Bqkm horizon:

Other features--Essentially continuously cemented, but broken in some places by burrowing animals.

2Bqk horizon:

Rock fragments--50 to 85 percent pebbles and cobbles.

Reaction--Slightly alkaline to strongly alkaline.

Grassycan Series

The Grassycan series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium derived from volcanic rocks. The Grassycan soils are on plateau summits and shoulders. Slopes are 0 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Abruptic Xeric Argidurids.

Typical pedon: Grassycan very stony fine sandy loam, in map unit 1430, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with approximately 5 percent stones, 10 percent cobbles, and 40 percent pebbles.

A1--0 to 1 inches; grayish brown (10YR 5/2) very stony fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; 5 percent stones, 10 percent cobbles and 40 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

A2--1 to 4 inches; light brownish gray (10YR 6/2) gravelly loam, dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--4 to 7 inches; pinkish gray (7.5YR 6/2) clay loam, dark brown (7.5YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; many thin and few moderately thick clay films on faces of peds; 10 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt2--7 to 12 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate fine prismatic structure parting to strong fine angular blocky; hard, firm, very sticky and very plastic; few very fine roots; common very fine tubular pores; common moderately thick clay films on faces of peds; 10 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bqm--12 to 13 inches; continuous indurated silica cemented duripan; extremely hard, extremely firm.

R--13 to 16 inches; hard basalt.

Type location: Washoe County, Nevada; about 3 miles southeast of Stevens Camp and 2.5 miles east of Grassy Canyon; about 1,500 feet south and 2,600 feet

east of northwest corner of section 21; T. 41 N.; R. 22 E.; (41 degrees, 27 minutes, 12 seconds north latitude; 119 degrees, 30 minutes, 28 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry mid-June through October

Soil temperature: 47 to 51 degrees F.

Depth to duripan and bedrock: 7 to 14 inches.

Control section:

Clay content--35 to 50 percent.

Rock fragments: Averages 5 to 25 percent, dominantly pebbles, when mixed.

A horizons:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Consistence--Soft or slightly hard, dry.

Bt horizons:

Hue--5YR, 7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Clay or clay loam.

Clay content--35 to 60 percent.

Rock fragments--Averages 5 to 25 percent, dominantly pebbles.

Structure--Subangular blocky or angular blocky in the upper part, prismatic parting to blocky in the lower part.

Other features--A clay increase of at least 15 percent occurs within a distance of 1 inch either between the A horizon and Bt horizons, or between the Bt1 and Bt2 horizons.

Bqm horizon:

Other features--Continuous 1 to 25 millimeter thick indurated silica laminar duripan.

Hackwood Series

The Hackwood series consists of very deep, well drained soils that formed in alluvium and colluvium derived from quartzite, conglomerate and igneous rocks with a component of loess. Hackwood soils are on hills and mountain side slopes. Slopes are 4 to 70 percent. The mean annual precipitation is about 18 inches and the mean annual temperature is about 41 degrees F.

Taxonomic class: Fine-loamy, mixed Pachic Cryoborolls

Typical pedon: Hackwood gravelly loam, in map unit 1258, aspen woodland. (Colors are for dry soil unless otherwise noted.)

Oi--0.5 to 0 inches; aspen leaf litter. (0.5 to 4 inches thick)

A1--0 to 4 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; strong medium and coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, medium and coarse roots; many very

fine and fine interstitial pores; 20 percent pebbles; slightly acid (pH 6.5); clear smooth boundary.

A2--4 to 13 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, medium and coarse roots; many very fine tubular pores; 20 percent pebbles; slightly acid (pH 6.4); clear wavy boundary.

A3--13 to 20 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, medium and coarse roots; many very fine tubular pores; 25 percent pebbles; neutral (pH 6.8); clear wavy boundary.

AC--20 to 32 inches; brown (10YR 5/3) gravelly loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine and many medium and coarse roots; common very fine tubular pores; 30 percent pebbles; slightly acid (pH 6.3); clear wavy boundary.

2C1--32 to 43 inches; pale brown (10YR 6/3) very gravelly clay loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, friable, sticky and plastic; common very fine and fine and many medium and coarse roots; common very fine tubular pores; 40 percent pebbles; slightly acid (pH 6.3); gradual smooth boundary.

2C2--43 to 60 inches; light brownish gray (10YR 6/2) very gravelly loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, sticky and plastic; few fine and common medium and coarse roots; few very fine tubular pores; few very thin silt coatings line pores; 45 percent pebbles; slightly acid (pH 6.2).

Type location: Washoe County, Nevada; in an aspen grove on the south side of Barrel Springs road; west of Bailey Mountain; about 1,100 feet west and 1,350 feet north of the southeast corner of section 20, T. 46 N., R. 19 E.; (41 degrees, 53 minutes, 25 seconds north latitude and 119 degrees, 52 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist late fall through summer, dry September and October.

Additional soil moisture: Supplied by lateral water movement in lower part of the control section or substratum. This additional moisture is transitory and dependent on snowpack and is sporadic.

Soil temperature: 38 to 44 degrees F.

Average summer soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 16 to 35 inches.

Depth to 2C horizon: 30 to 49 inches.

Reaction: Neutral or slightly acid, decreasing with depth.

Control section:

Clay content--Averages 18 to 30 percent.

Rock fragments--Averages 15 to 35 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3 dry, 1 or 2 moist.

AC horizon:

Hue--2.5Y or 10YR.

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Texture--Silt loam, loam, gravelly silt loam, and gravelly loam.

Structure--Subangular blocky or is massive.

Consistence--Slightly hard or hard, dry; very friable or friable, moist; slightly sticky or sticky and slightly plastic or plastic, wet.

2C horizons:

Hue--2.5Y or 10YR.

Value--6 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Structure--Subangular blocky or is massive.

Consistence--Slightly hard or hard, dry; very friable or friable, moist; slightly sticky or sticky and slightly plastic or plastic, wet.

Texture--Commonly very gravelly loam, very gravelly clay loam, gravelly clay loam, gravelly silty clay loam.

Other features--Pores are lined with very thin silt coats or uncoated sand grains. Some pedons have few to common fine distinct 10YR 5/6 dry and 4/4 moist mottles. Some pedons have few manganese stains coating pebbles and lining pores.

Halvert Series

Halvert series consists of moderately deep, well drained soils that formed in colluvium and alluvium from basalt and andesite. The Halvert soils are on interplateau side slopes. Slopes are 0 to 8 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Very-fine, montmorillonitic, mesic Vertic Durixerolls

Typical pedon: Halvert gravelly loam, in map unit 1125, rangeland (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; grayish-brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; strong thin and medium platy structure; hard, very friable, sticky, plastic; many very fine roots; many very fine vesicular and interstitial pores; 5 percent cobbles, 15 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--2 to 5 inches; brown (7.5YR 5/2) gravelly clay loam, dark brown (7.5YR 3/2) moist; strong very fine and fine subangular blocky structure; hard, very friable, sticky, plastic; many very fine, common fine roots; many very fine tubular, common very fine vesicular pores; 5 percent cobbles, 15 percent pebbles; common thin pinkish gray (7.5YR 7/2) uncoated sand grains on

horizontal faces of peds; slightly alkaline (pH 7.6); abrupt wavy boundary.

Btss--5 to 21 inches; dark brown (7.5YR 4/3) clay, dark brown (7.5YR 3/3) moist; moderate fine and medium prismatic structure parting to strong very fine and fine angular blocky; extremely hard, very firm, very sticky, very plastic; common very fine and few fine roots; few very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; vertical cracks 8 millimeters to 1 centimeter wide and 4 to 6 inches apart extend from a depth of 5 to 18 inches; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 10 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Btqk--21 to 27 inches; pink (7.5YR 7/4) gravelly clay, brown (7.5YR 5/4) moist; strong medium and coarse angular blocky structure; hard, friable, very sticky, very plastic; common very fine roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and lining pores; 5 percent cobbles, 15 percent pebbles; 0.5 to 1.0 millimeter thick silica and lime coats on 50 percent of underside of rock fragments; few fine soft masses of lime; moderately alkaline (pH 8.4); abrupt wavy boundary.

Bqkm--27 to 32 inches; continuous 2 to 3 millimeter silica laminae capped indurated duripan; strong thin and medium platy structure; extremely hard, extremely firm; alternate medium horizontal plates with laminar cap; horizontal root mat at upper boundary with many very fine, fine and few medium roots; violently effervescent in few places; clear smooth boundary.

Cr--32 to 40 inches; fractured basalt with clay and silica in fractures

Type location: Washoe County, Nevada. On the Barrel Springs road at the Nevada-California state line; about 1,700 feet north and 75 feet east of the southwest corner of section 20, T. 46 N., R. 18 E.; (41 degrees, 53 minutes, 30 seconds north latitude and 119 degrees, 59 minutes, 52 seconds west longitude.)

Range in Characteristics:

Soil moisture: moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Thickness of mollic: 12 to 24 inches

Depth to duripan: 20 to 32 inches

Depth to bedrock: 24 to 40 inches

Control section:

Clay content--60 to 70 percent

Rock fragments--10 to 25 percent, mainly pebbles

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Value of 6 only in upper 2 inches or uncoated sand grains

Chroma--2 or 3

Reaction: Neutral or slightly alkaline

Btss horizon:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 3 or 4 moist

Chroma--3 or 4

Clay content--60 to 70 percent in the upper part

Texture--Clay or gravelly clay

Rock fragments--10 to 25 percent, mainly pebbles

Consistence--Hard through extremely hard dry, friable to very firm moist

Reaction--Slightly alkaline or moderately alkaline

Other features--Vertical cracks 5 to 25 millimeters wide, few to common slickensides and wedge-shaped aggregates

Btqk horizon:

Hue--10YR or 7.5YR

Value--5 through 7 dry, 4 through 6 moist

Chroma--3 or 4

Clay content--55 to 65 percent

Reaction--slightly or moderately alkaline

Effervescence--Noneffervescent or slightly effervescent; few fine or medium soft masses of lime

Bqkm horizon:

Cementation--Continuous 2 to 3 millimeter silica laminae capped indurated duripan

Hangrock Series

The Hangrock series consists of shallow to a duripan, well drained soils that formed in alluvium derived from volcanic rocks and vitric pyroclastic materials. Hangrock soils are on fan piedmonts often overlapped on pediments. Slopes are 2 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic, shallow Haploxeralfic Argidurids

Typical pedon: Hangrock very gravelly loam, in map unit 1150, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered by approximately 5 percent cobbles, 40 percent pebbles.

A--0 to 4 inches; light brownish gray (10YR 6/2) very gravelly loam, dark brown (10YR 3/3) moist; moderate medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine interstitial pores; 5 percent cobbles, 35 percent pebbles; neutral (pH 6.6); clear smooth boundary.

Bt1--4 to 9 inches; pale brown (10YR 6/3) gravelly clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; common thin clay films on faces of peds; 15 percent pebbles; neutral (pH 6.6); clear smooth boundary.

Bt2--9 to 17 inches; light yellowish brown (10YR 6/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine prismatic parting to strong medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; common moderately thick clay films on faces of peds; 15 percent pebbles; neutral (pH 6.8) abrupt wavy boundary.

Bqm--17 to 24 inches; strongly cemented duripan with fractured discontinuous lenses of very rigid material; massive; extremely hard, extremely firm; 30 percent pebbles; slightly alkaline (pH 7.4); gradual wavy boundary.

Bqkm--24 to 60 inches; strongly cemented duripan consisting of many strongly cemented plates with weakly cemented material between the plates; 30 percent pebbles; thin lime coatings on some rock fragments and duripan fragments; strongly effervescent matrix; slightly alkaline (pH 7.6).

Type location: Washoe County, Nevada; about 1 1/2 miles southeast of Hanging Rock Canyon; 2,200 feet north and 200 feet east of the southwest corner of section 31, T. 42 N., R. 23 E.; (41 degrees, 30 minutes, 35 seconds north latitude and 119 degrees, 26 minutes, 18 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry early June through October.

Soil temperature: 47 to 52 degrees F.

Depth to duripan: 14 to 20 inches.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

A horizon:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 3 or 4 moist, (after mixing 7 inches value greater than 5.5 dry)

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--2 through 4 or 6.

Texture--Loam or clay loam.

Clay content--25 to 35 percent.

Rock fragments--15 to 35 percent, dominantly pebbles.

Bqm horizon:

Cementation--Most fragments will fail at 1 joule; very rigid pieces will typically fail at 3 joules.

Hapgood Series

The Hapgood series consists of deep, well drained soils that formed in colluvium from mixed rocks with a component of loess and mixed volcanic ash. Hapgood soils are dominantly on hills and mountain sideslopes. Slopes are 4 to 70 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed Pachic Cryoborolls

Typical pedon: Hapgood very gravelly loam, in map unit 1345, rangeland. (Colors are for dry soil unless otherwise noted)

A1--0 to 3 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; moderate thin and medium platy structure; soft, very friable, nonsticky and slightly plastic; few fine and many very fine roots; many fine interstitial and few very fine tubular pores; 40 percent pebbles; slightly acid (pH 6.4); clear smooth boundary.

A2--3 to 8 inches; dark grayish brown (10YR 4/2) very gravelly loam, very dark brown (10YR 2/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine and medium and many very fine roots; many very fine interstitial and common very fine tubular pores; 40 percent pebbles; neutral (pH 6.6); clear smooth boundary.

A3--8 to 26 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine, and many very fine roots; many very fine interstitial, and common very fine tubular pores; 30 percent pebbles; neutral (pH 6.6); clear smooth boundary.

AC--26 to 36 inches; grayish brown (10YR 5/2) very gravelly loam, dark brown (10YR 3/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine and many very fine roots; many very fine interstitial and common very fine tubular pores; 50 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

C--36 to 50 inches; very pale brown (10YR 7/3) very cobbly loam, brown (10YR 5/3) moist; many fine and medium faint brown (10YR 5/3) iron stains along vertical cleavage planes; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine, and common very fine roots; common very fine tubular pores; 20 percent cobbles and 20 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

R--50 to 54 inches; hard, fractured andesite.

Type location: Washoe County, Nevada; approximately 60 miles west of Denio Junction; 300 feet north and 450 feet east of the southwest corner of section 10, T. 46 N., R. 19 E.; (41 degrees, 54 minutes, 59 seconds north latitude and 119 degrees, 50 minutes, 46 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry late July through early October.

Mean annual soil temperature: 38 to 47 degrees F.

Average summer soil temperature: 55 to 59 degrees F.

Mollic epipedon thickness: 16 to 60 inches.

Depth to bedrock: 40 to 60 inches.

Control section:

Clay content--18 to 27 percent.

Rock fragments--35 to 50 percent, dominantly pebbles.

Reaction--Slightly acid or neutral.

A horizons:

Hue--10YR or 7.5YR

Value--2 through 5 dry, 2 or 3 moist.

Chroma--1 through 3 in most pedons, chroma of 1 is common only in A1 horizon and chroma of 3 is common only in A3 horizon or below.
 Base saturation--50 to 75 percent in upper part.
 Other features--A4 horizons may replace AC horizon in some pedons.

C horizon:

Hue--10YR or 7.5YR.
 Value--4 through 7 dry, 3 through 5 moist.
 Chroma--2 through 6.
 Texture--Predominantly loam, but strata of fine sandy loam, sandy loam, silt loam or clay loam are permissible.
 Other features--Some pedons lack C horizons where the mollic epipedon rests on the bedrock at depths less than 48 inches.

Hart Camp Series

The Hart Camp series consists of shallow, well drained soils that formed in residuum weathered from tuff. The Hart Camp soils are on rock pediment remnants, plateaus, mountains and hills. Slopes are 4 to 30 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy, mixed, frigid, shallow Aridic Argixerolls

Typical pedon: Hart Camp stony loam, in map unit 1275, rangeland. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 2 percent stones, 5 percent cobbles, and 15 percent pebbles.

A--0 to 3 inches; brown (10YR 5/3) stony loam, very dark grayish brown (10YR 3/2) moist; moderate very thin platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and fine vesicular and interstitial pores; 2 percent stones, 5 percent cobbles and 15 percent pebbles; neutral (pH 7.0); clear smooth boundary.

BA--3 to 8 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine roots; many very fine tubular pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

BT1--8 to 12 inches; brown (10YR 5/3) gravelly clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine and fine roots; common very fine tubular pores; 25 percent pebbles; many thin clay films on faces of peds and in pores; neutral (pH 7.0); clear wavy boundary.

BT2--12 to 16 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, friable, sticky and plastic; many very fine and fine roots; many very fine tubular pores; 25 percent pebbles; common thin and moderately thick clay films on faces of peds and in pores; neutral (pH 6.7); abrupt irregular boundary.

Cr--16 to 20 inches; light yellowish brown (10YR 6/4) weathered tuff, common thin and few moderately thick clay films at the upper boundary and in few places.

Type location: Washoe County, Nevada; approximately 2,000 feet north of Barrel Springs road; about 2,000 feet east and 1,300 feet south of the northwest corner of section 20, T. 46 N., R. 19 E.; (41 degrees, 53 minutes, 50 seconds north latitude and 119 degrees, 52 minutes, 44 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist winter and spring, dry late June through October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 7 to 15 inches, includes part or all of argillic horizon.

Profile reaction: Slightly acid to neutral.

Depth to weathered bedrock: 10 to 20 inches.

Control section:

Clay content--Averages 18 to 35 percent.

Rock fragments--Averages 15 to 35 percent.

A horizon:

Value--4 through 6 dry, 2 or 3 moist. When the surface 7 inches are mixed, its value is less than 5.5.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 2 through 4 moist.

Chroma--2 through 4.

Texture--Gravelly sandy clay loam, gravelly clay loam, gravelly loam.

Clay content--20 to 35 percent. Subhorizons of clay occur in some pedons.

Rock fragments--Averages 15 to 35 percent.

Structure--Weak to strong, fine to coarse subangular or angular blocky or has moderate or strong, fine or medium prismatic in some pedons.

Hartig Series

The Hartig series consists of deep, well drained soils that formed in colluvium from andesite, dacite, rhyolite and volcanic tuff. The Hartig soils are on mountain sideslopes. Slopes are 8 to 70 percent. The mean annual precipitation is about 14 inches and the mean annual temperature 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Aridic Haploxerolls

Typical pedon: Hartig gravelly loam, in map unit 1272, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 10 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak very fine and fine platy structure; soft, very friable, nonsticky and nonplastic; many fine roots; many fine and very

fine interstitial pores; 15 percent pebbles; slightly acid (pH 6.4); abrupt smooth boundary.

Bw--10 to 21 inches; light brownish gray (10YR 6/2) very gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many fine roots; common very fine tubular pores; 40 percent fine pebbles; neutral (pH 6.8); gradual smooth boundary.

C--21 to 42 inches; light yellowish brown (10YR 6/4) very gravelly loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; many very fine interstitial pores; 55 percent pebbles and cobbles; neutral (pH 7.0); abrupt wavy boundary.

R--42 to 46 inches--unweathered bedrock.

Type location: Washoe County, Nevada; approximately 1,000 feet southeast of the northwest corner of section 9, T. 46 N., R. 19 E.; (41 degrees, 55 minutes, 42 seconds north latitude and 119 degrees, 51 minutes, 52 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from June through mid October.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon: 10 to 20 inches thick, may include upper part of cambic horizon.

Effervescence: Noneffervescent throughout profile.

Depth to bedrock: 40 to 60 inches.

Control section:

Clay content--12 to 18 percent.

Rock fragments--35 to 60 percent.

A horizon:

Hue--10YR or 7.5YR.

Value--4 or 5 dry.

Chroma--2 or 3 moist.

Consistence--Soft or slightly hard, dry.

Reaction--Slightly acid or neutral.

Bw horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3.

Texture--Loam, sandy loam.

Clay content--12 to 20 percent.

Rock fragments--35 to 60 percent.

Reaction--Slightly acid or neutral.

C horizon:

Hue--10YR or 7.5YR.

Value--6 or 7 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Loam or sandy loam.

Clay content--10 to 18 percent.

Rock fragments--35 to 60.

Structure--Subangular blocky or massive.

Consistence--Very friable and friable, moist.

Indian Creek Series

The Indian Creek series consists of shallow well drained soils that formed in mixed alluvium. The Indian Creek soils are on terraces and dissected alluvial fans. Slopes are 4 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual air temperature is about 50 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Xeric Argidurids

Typical pedon: Indian Creek very cobbly loam, in map unit 1285, rangeland. (Colors are for dry soil unless otherwise noted.) The surface is partially covered with 20 percent cobbles and 15 percent pebbles.

A1--0 to 2 inches; pale brown (10YR 6/3) very cobbly loam, dark brown (10YR 3/3) moist; moderate thin platy structure; slightly hard, very friable, sticky and plastic; many very fine roots; common fine and very fine vesicular pores; few uncoated sand grains; 20 percent cobbles and 15 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

A2--2 to 5 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 3/3) moist; moderate very fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, common fine, and few medium roots; many fine and very fine interstitial pores; many uncoated sand grains; 25 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--5 to 10 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark brown (7.5YR 3/4) moist; strong fine and medium subangular blocky structure; hard, very friable, very sticky and very plastic; many very fine, common fine, and few medium roots; common very fine tubular pores; many moderately thick clay films on faces of peds and in pores; 25 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--10 to 18 inches; strong brown (7.5YR 5/6) gravelly clay, dark brown (7.5YR 4/4) moist; strong fine and medium angular blocky structure; hard, very friable, very sticky and very plastic; common very fine and few fine and medium roots; few very fine tubular pores; many moderately thick clay films on faces of peds and in pores; 20 percent pebbles; moderately alkaline (pH 7.4); abrupt wavy boundary.

Bqkm--18 to 25 inches; white (10YR 8/2) indurated duripan, light yellowish brown (10YR 6/4) moist; strong thick and very thick platy structure; extremely hard, extremely firm and very firm; few very fine and fine roots in horizontal root mat at upper boundary and between some plates; 70 percent cemented pebbles; continuous 1 to 2 millimeter thick horizontal silica laminae; many moderately thick and thick silica coats; strongly effervescent between plates and surface of plates; moderately alkaline (pH 8.0); abrupt wavy boundary.

2Ck1--25 to 36 inches; light gray (10YR 7/2) extremely gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; hard, very friable, nonsticky and nonplastic; few very fine and fine roots; many fine

interstitial pores; 60 percent pebbles; common fine and medium lime coats on underside of pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

3Ck2--36 to 60 inches; light brownish gray (10YR 6/2) very gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable; few very fine roots; many fine interstitial pores; 50 percent pebbles; common fine and medium lime coats on underside of pebbles; slightly alkaline (pH 7.4).

Type location: Washoe County, Nevada; about 500 feet west and 100 feet north of the southeast corner of section 21, T. 43 N., R. 18 E.; (41 degrees, 37 minutes, 33 seconds north latitude and 119 degrees, 57 minutes, 55 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist during winter and spring.

Soil temperature: 50 to 53 degrees F.

Depth to duripan: 14 to 20 inches.

Control section:

Clay content--35 to 55 percent.

A horizons:

Value--5 or 6 dry, 2 or 3 moist.

Chroma--2 or 3

Reaction--Slightly acid or neutral

Other features--It commonly has a desert pavement of pebbles, cobbles and stones lightly coated with desert varnish.

Bt horizons:

Hue--10YR, 7.5YR or 5YR

Value--4 through 6 dry, 3 through 5 moist

Chroma--4 through 6

Texture--Clay, sandy clay or gravelly clay

Clay content--35 to 55 percent

Rock fragments--5 to 35 percent, mainly pebbles

Reaction--Slightly acid to slightly alkaline

Bqkm horizon:

Cementation--Continuous indurated cap or plates with strong silica cementation below

C horizons:

Texture--Loamy coarse sand, coarse sandy loam, sandy loam or sandy clay loam

Rock fragments--40 to 80 percent, mainly pebbles and some cobbles with a few stones

Secondary lime accumulation--Occur as filaments or soft masses or as coatings on underside of rock fragments.

Isolde Series

The Isolde series consists of very deep, excessively drained soils that formed in eolian sand from mixed rock sources. Isolde soils are on semi-stabilized dunes over lake plains, beach terraces, lake beds, playas, lake terraces, alluvial fans and uplands. Slopes are 2 to 15

percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 52 degrees F.

Taxonomic class: Mixed, mesic Typic Torripsamments

Typical pedon: Isolde fine sand, in map unit 1215, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 7 inches; light gray (10YR 7/2) fine sand, dark grayish brown (10YR 4/2) moist; single grained; loose, nonsticky and nonplastic; many very fine roots; many very fine and fine interstitial pores; moderately alkaline (pH 8.4); clear wavy boundary.

C1--7 to 24 inches; light gray (10YR 7/2) fine sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine and fine interstitial pores; moderately alkaline (pH 8.4); clear smooth boundary.

C2--24 to 42 inches; light gray (10YR 7/2) fine sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine, common fine and few medium roots; many very fine and fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

C3--42 to 55 inches; light gray (10YR 7/2) fine sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine and medium roots; many very fine and fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.4); clear wavy boundary.

Ck--55 to 62 inches; light gray (10YR 7/2) fine sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine and medium roots; many very fine and fine interstitial pores; few fine soft masses of lime; strongly effervescent; moderately alkaline (pH 8.4).

Type location: Washoe County, Nevada; 1,200 feet west and 1,600 feet south of the northeast corner of section 17, T. 41 N., R. 18 E.; (41 degrees, 28 minutes, 36 seconds north latitude and 119 degrees, 59 minutes, 24 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in winter and spring, dry from summer to mid fall.

Soil temperature: 53 to 57 degrees F.

Reaction: Neutral to moderately alkaline.

Control section:

Texture--Commonly fine sand or in some pedons sand, with 50 to 80 percent passing number 40 sieve and 1 to 10 percent passing the number 200 sieve.

A horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 or 3.

C horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 or 3.

Other features--Some pedons have a 2C horizon below 40 inches. In some pedons the lower C horizon is moderately to strongly alkaline and noneffervescent to strongly effervescent.

Jaybee Series

The Jaybee series consists of very shallow and shallow, well drained soils that formed in residuum and colluvium from basic volcanic rocks primarily from basalt. Jaybee soils are on hills, mountains and plateaus. Slopes are 2 to 8 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy, mixed, mesic Lithic Xeric Haplargids

Typical pedon: Jaybee very cobbly loam, in map unit 1125, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 2 percent stones, 20 percent pebbles, and 25 percent cobbles.

A1--0 to 4 inches; pale brown (10YR 6/3), very cobbly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; common very fine vesicular pores; 2 percent stones, 20 percent cobbles, 15 percent pebbles; slightly alkaline (pH 7.4); clear smooth boundary.

Bt1--4 to 8 inches; brown (10YR 5/3) gravelly clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; few very fine roots; few very fine tubular and common very fine interstitial pores; common thin clay films on faces of peds and in pores; 25 percent pebbles, neutral (pH 7.2); clear smooth boundary.

Bt2--8 to 14 inches; yellowish brown (10YR 5/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate medium prismatic structure parting to fine subangular blocky; hard; very friable, very sticky and very plastic; few very fine and common medium and coarse roots; common very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 20 percent pebbles, 5 percent cobbles; neutral (pH 6.8); abrupt irregular boundary.

R--14 to 18 inches; fractured hard basalt.

Type location: Washoe County, Nevada; on the Barrel Springs road about 400 feet east of the Nevada-California state line; about 1,000 feet north and 400 feet east of the southwest corner of section 20, T. 46 N., R. 18 E.; (41 degrees, 53 minutes, 22 seconds north latitude and 119 degrees, 59 minutes, 47 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry during summer and fall, moist winter and spring.

Soil temperature: 54 to 57 degrees F.

Depth to lithic contact: 7 to 14 inches.

Control section:

Clay content--25 to 35 percent.

Rock fragments--Averages 15 to 35 percent after mixing

A horizon:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--2 through 4.

Reaction--Neutral or slightly alkaline.

Other features--The surface 7 inches has value lighter than 5.5 dry or 3.5 moist after mixing.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist

Chroma--2 through 4.

Texture--Clay or clay loam.

Clay content--35 to 45 percent.

Reaction--Neutral or slightly alkaline.

Karlo Series

The Karlo series consists of moderately deep, well drained soils that formed in residuum from volcanic rocks. Karlo soils are on plateaus. Slopes range from 0 to 8 percent. The mean annual precipitation is about 11 inches and the mean annual air temperature is about 44 degrees F.

Taxonomic class: Very-fine, montmorillonitic, frigid Leptic Haploxererts

Typical pedon: Karlo very cobbly clay, in map unit 1180, rangeland (Colors are for dry soil unless otherwise noted). The soil surface is partially covered with 30 percent cobbles and 20 percent pebbles.

A1--0 to 3 inches; dark reddish brown (5YR 3/3) very cobbly clay, dark brown (7.5YR 3/2) moist; strong very fine and fine granular structure; hard, very friable, very sticky and very plastic; common very fine and fine roots; many very fine interstitial pores; 30 percent cobbles and 20 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

A2--3 to 5 inches; dark reddish brown (5YR 3/3) silty clay, dark brown (7.5YR 3/2) moist; moderate fine angular blocky structure; hard, friable, very sticky and very plastic; common very fine and fine roots; many very fine and fine interstitial pores; vertical cracks 10 to 30 millimeters wide and 3 to 6 inches apart; slightly alkaline (pH 7.4); clear smooth boundary.

A3--5 to 10 inches; dark reddish brown (5YR 3/3) clay, dark brown (7.5YR 3/2) moist; moderate coarse prismatic structure parting to strong fine and medium angular blocky; very hard, friable, very sticky and very plastic; common very fine and fine roots; common very fine interstitial pores; vertical cracks 10 to 20 millimeters wide and about 3 to 6 inches apart; pressure faces on 60 percent of faces of peds; slightly alkaline (pH 7.4); clear smooth boundary.

Bwss--10 to 25 inches; reddish brown (5YR 4/3) clay, dark reddish brown (5YR 3/3) moist; strong coarse prismatic

structure parting to strong fine and medium angular blocky; very hard, firm, very sticky and very plastic; few very fine roots; common very fine interstitial pores; vertical cracks 10 millimeters to 1 centimeter wide and about 3 to 6 inches apart; common wedge-shaped aggregates tilted 30 degrees from horizontal; many intersecting slickensides; moderately alkaline (pH 8.0); clear smooth boundary.

- Bkss--25 to 30 inches; reddish brown (5YR 4/3) silty clay, dark brown (7.5YR 3/4) moist; strong fine and medium angular blocky structure; hard, friable, very sticky and very plastic; few very fine roots; few very fine tubular pores; few wedge-shaped aggregates tilted 30 degrees from horizontal; few slickensides; few fine lime masses; moderately alkaline (pH 8.2); abrupt smooth boundary.
- R--30 to 34 inches; hard basalt; strong brown (7.5YR 5/6) decomposed rock materials in fractures; thin continuous white lime coats on fractured faces.

Type location: Washoe County, Nevada; about 2,000 feet west and 2,500 feet south of the northeast corner of sec. 33, T. 46 N., R. 19 E.; (41 degrees, 51 minutes, 54 seconds north latitude and 119 degrees, 51 minutes, 19 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 45 degrees.

Depth to bedrock: 24 to 40 inches

Other features: Cracks are open to the surface for about 150 to 180 days. (mid-June to November).

Control section:

Clay content--60 to 70 percent.

A horizons:

Hue--10YR, 7.5YR or 5YR

Value--3 or 4 dry or moist

Chroma--2 through 4

Reaction--Slightly acid to slightly alkaline

Other features--A surface cover of 20 to 60 percent basalt cobbles is present in most pedons.

Bwss and Bkss horizons:

Hue--10YR, 7.5YR or 5YR,

Value--3 or 4 dry or moist.

Chroma--2 through 4.

Structure--Prismatic, subangular blocky or angular blocky

Reaction--Mildly alkaline or moderately alkaline

Other features--Slickensides are on 20 to 70 percent of faces of peds

Langston Series

The Langston series consists of very deep, well drained soils that formed in alluvium over lake sediments derived from mixed sources. Langston soils are on lake terraces and alluvial fan piedmonts. Slopes are 2 to 8 percent. The

mean annual precipitation is about 8 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine-loamy over sandy or sandy-skeletal, mixed, mesic Xeric Haplargids

Typical pedon: Langston gravelly sandy loam, in map unit 1040, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; pale brown (10YR 6/3) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; strong thin and medium platy structure; hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine and fine vesicular pores; 25 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt--3 to 11 inches; pale brown (10YR 6/3) gravelly sandy clay loam, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and fine, common medium and few coarse roots; many very fine tubular pores; common thin clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

2Bk1--11 to 19 inches; very pale brown (10YR 7/4) very gravelly sand, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial pores; 50 percent pebbles; few (2 percent) very thin lime pendants on rock fragments; slightly effervescent; slightly alkaline (pH 7.4); abrupt wavy boundary.

3Bk2--19 to 29 inches; very pale brown (10YR 7/3) very gravelly coarse sand, brown (10YR 5/3) moist; massive; loose when dry and moist; few very fine and medium roots; many very fine interstitial pores; 50 percent pebbles; common (20 percent) very thin lime pendants on rock fragments; strongly effervescent; slightly alkaline (pH 7.6); clear wavy boundary.

4C--29 to 60 inches; variegated colored, extremely gravelly coarse sand and extremely gravelly sand; massive; loose when dry and moist; no roots observed; many very fine interstitial pores; 75 percent pebbles; strongly effervescent; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; about 4.5 miles east of Vya on Road 8A to power line; about 0.4 miles south along power line in an unsectioned area. (41 degrees, 34 minutes, 40 seconds north latitude and 119 degrees, 45 minutes, 18 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from June through October.

Soil temperature: 47 to 52 degrees F.

Depth to discontinuity: 11 to 20 inches.

Control section:

Clay content--18 to 30 percent in the upper part and 0 to 5 percent in the lower part.

Rock fragments--Averages 10 to 35 percent in the upper part and 65 to 90 percent in the lower part.

A horizon:

Value--5 through 7 dry, 3 or 4 moist, when mixed.

Chroma--2 or 3.
Reaction--Slightly acid or neutral.

Bt horizon:

Hue--7.5YR or 10YR.
Value--5 or 6 dry, 4 or 5 moist.
Chroma--2 or 3.
Texture--Sandy clay loam, clay loam, loam.
Clay content--18 to 30 percent.
Rock fragments--Averages 10 to 35 percent.
Reaction--Slightly acid to slightly alkaline.
Structure--Subangular blocky or is massive.

Bk horizons:

Hue--2.5Y or 10YR.
Value--3 through 7 dry, 3 through 5 moist.
Chroma--1 through 3.
Texture--Stratified gravelly sand through extremely gravelly coarse sand.
Rock fragments--Averages 65 to 90 percent, most of which are pebbles.
Reaction--Slightly alkaline or moderately alkaline.
Other features--Depth to lime coatings on rock fragments, 11 to 40 inches. Some pedons have thin silica coats on undersides of rock fragments.
Effervescence--Noneffervescent to violently effervescent.

C horizons:

Other features--Horizons may be present in some pedons.

Layview Series

The Layview series consists of shallow, well drained soils that formed in residuum and colluvium from andesite, rhyolite, chert and tuff. Layview soils are on mountain crests, summits, shoulders and side slopes. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed Argic Lithic Cryoborolls

Typical pedon: Layview very gravelly loam, in map unit 1345, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 5 percent cobbles and 40 percent pebbles.

A1--0 to 1 inch; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak very fine and fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine vesicular pores; 5 percent cobbles, 45 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--1 to 4 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, sticky and plastic; few very fine roots; many very fine vesicular pores; 50 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt1--4 to 12 inches; brown (10YR 4/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine medium subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; common thin clay films on faces of peds and in pores; 45 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bt2--12 to 14 inches; yellowish brown (10YR 5/4) very gravelly loam, dark brown (10YR 3/3) moist; weak medium angular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and few fine roots; many very fine tubular pores; few thin clay films on faces of peds and in pores; 40 percent pebbles; slightly alkaline (pH 7.8); abrupt irregular boundary.

2R--14 to 18 inches; hard volcanic andesite with few fractures.

Type location: Washoe County, Nevada; about 600 feet west and 1,000 feet north of southeast corner of section 16, T. 46 N., R. 19 E.; (41 degrees, 54 minutes, 14 seconds north latitude and 119 degrees, 51 minutes, 01 second west longitude.)

Range in Characteristics:

Soil moisture: These soils are usually dry during summer and fall, moist mid-October through mid-July.

Soil temperature: 43 to 47 degrees F.

Average summer soil temperature: 50 to 59 degrees F.

Depth to bedrock: 10 to 14 inches.

Reaction: Neutral or slightly alkaline.

Mollic epipedon thickness: 7 to 12 inches.

Control section:

Clay content--18 to 30 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Very gravelly loam or very gravelly clay loam.

Clay content--22 to 35 percent.

Rock fragments--35 to 60 percent, mainly pebbles.

Structure--Weak or moderate subangular or angular blocky.

Consistence--Soft to hard, very friable or friable, slightly sticky or sticky and slightly plastic or plastic.

Lofftus Series

The Lofftus series consists of moderately deep to a duripan, somewhat poorly drained soils that formed in lacustrine sediments with an ash mantle. Lofftus soils are on low terraces in basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 9 inches and the annual temperature is about 47 degrees F.

Taxonomic class: Ashy, mesic Aquicambidic Haplodurids

Typical pedon: Lofthus silt loam, in map unit 1115, rangeland. (Colors are for dry soil unless otherwise noted.)

Akn--0 to 2 inches; gray (10YR 6/1) silt loam, dark grayish brown (10YR 4/2) moist; moderate very thin platy structure; slightly hard, friable, very sticky and plastic; many very fine and fine roots; common fine vesicular pores; strongly effervescent, carbonates are disseminated; white salt and black organic staining occur in patches on the soil surface; strongly alkaline (pH 9.0); clear smooth boundary.

Bkn1--2 to 11 inches; light gray (10YR 7/1) silt loam, dark grayish brown (2.5Y 4/2) moist; weak very thin platy structure; slightly hard, friable, very sticky and plastic; many very fine and fine roots; common very fine tubular pores; strongly effervescent, carbonates are disseminated; strongly alkaline (pH 8.8); clear smooth boundary.

Bkn2--11 to 30 inches; light gray (10YR 7/1) silt loam, dark grayish brown (2.5Y 4/2) moist; weak very thin platy structure; soft, very friable, very sticky and plastic; many fine and medium roots to 24 inches, few below; violently effervescent, carbonates are disseminated; strongly alkaline (pH 8.8); abrupt smooth boundary.

2Bkqm--30 to 50 inches; light gray (10YR 7/1) duripan, dark grayish brown (2.5Y 4/2) moist; strongly cemented; strong very thick platy structure; very hard, very firm, brittle; few fine tubular pores; coatings of silica in some pores and on the surface of the pan; violently effervescent, carbonates are disseminated; strongly alkaline (pH 8.8); abrupt wavy boundary.

3C--50 to 60 inches; stratified lacustrine sediments.

Type location: Washoe County, Nevada; in Coleman Valley; about 2,400 feet west and 200 feet south of the northeast corner of section 13, T. 47N., R. 19 E.; (41 degrees, 59 minutes, 50 seconds north latitude and 119 degrees, 47 minutes, 55 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry mid-June through October. These soils have a perched water table at a depth of 1 to 3 feet from March through June.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 20 to 40 inches

Mineralogy: 30 to 60 percent glass in the silt and sand fraction

Control section:

Clay content--8 to 18 percent

Bulk density--0.8 to 1.0 g/cc

Electrical conductivity--8 to 16 mmhos/cm

SAR: 25 to 50

A horizon:

Value--6 or 7 dry, 3 or 4 moist

Chroma--1 or 2

Bkn horizons:

Hue--10YR, 2.5Y or neutral

Value--6 or 7 dry, 4 or 5 moist

Chroma--0 through 2

Other--Layers of white ash a few inches thick are in some pedons

Longdis Series

The Longdis series consists of very deep, well drained soils that formed in mixed lacustrine sediments influenced by volcanic ash. The Longdis soils are on lake terraces and basin rims. Slopes are 0 to 2 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Xeric Natrargids.

Typical pedon: Longdis silty clay loam, in map unit 1310, rangeland (Colors are for dry soil unless otherwise noted.)

A1--0 to 5 inches; light brownish gray (10YR 6/2) silty clay loam, dark brown (10YR 3/3) moist; moderate very thin and thin platy structure; slightly hard, very friable, sticky and plastic; many very fine roots; many very fine vesicular pores; moderately alkaline (pH 8.0); abrupt wavy boundary.

Bt1--5 to 11 inches; light brownish gray (10YR 6/2) silty clay, dark brown (10YR 3/3) moist expd, dark yellowish brown (10YR 4/4) moist crushed; strong fine and medium prismatic structure parting to strong fine and medium subangular blocky; very hard, firm, very sticky and very plastic; many very fine and fine roots; common very fine tubular pores; many thin clay films on faces of peds and lining pores; moderately alkaline (pH 8.0); abrupt wavy boundary.

Bt2--11 to 26 inches; pale brown (10YR 6/3) clay, dark grayish brown (10YR 4/2) moist; strong fine and medium prismatic structure parting to strong fine and medium angular blocky; very hard, firm, very sticky and very plastic; many very fine and fine roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; slightly effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Btk--26 to 45 inches; pale brown (10YR 6/3) silty clay loam, brown (10YR 4/3) moist; strong very fine angular blocky structure; hard, firm, very sticky and very plastic; common very fine roots; few very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; common fine soft masses of lime; strongly effervescent; strongly alkaline (pH 9.0); abrupt smooth boundary.

2C--45 to 61 inches; light brownish gray (2.5Y 6/2) stratified silty clay and silty clay loam, grayish brown (2.5Y 5/2) moist; massive; hard and very hard, friable and firm, very sticky and very plastic; few very fine tubular pores; strongly alkaline (pH 9.0).

Type location: Washoe County, Nevada. At the north end of Long Valley; about 2,300 feet south, 450 feet west of the northeast corner of section 2, T. 44 N., R. 19 E.; (41 degrees, 45 minutes, 52 seconds north latitude and 119 degrees, 48 minutes, 37 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 51 degrees F.

Depth to carbonates: 11 to 24 inches.

Control section:

Clay content--40 to 50 percent.

A horizon:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Slightly alkaline or moderately alkaline.

Btn horizons:

Value--5 through 7 dry; 3 through 5 moist.

Chroma--2 through 4.

Clay content--40 to 50 percent

Texture--Silty clay or clay.

SAR--13 to 45.

Reaction--Moderately alkaline or strongly alkaline.

Btnk horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry; 3 through 5 moist.

Chroma--2 through 4.

Clay content--35 to 50 percent.

Texture--Silty clay, clay or silty clay loam.

SAR--13 to 45.

Effervescence--Slightly effervescent or strongly effervescent; few to many fine to large soft masses of lime in the lower part.

Other features--Few or common fine or medium soft masses of gypsum in the lower part are in some pedons.

C horizon:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 4 through 6 moist.

Chroma--2 through 4.

Texture--Usually stratified; dominantly silty clay loam, silty clay or clay, but includes strata of loam, clay loam, fine sandy loam or very fine sandy loam.

Clay content--35 to 45 percent.

Structure--Platy or is massive.

Consistence--Hard or very hard dry, very friable through firm moist.

Effervescence--Noneffervescent to violently effervescent; few or common fine to medium soft masses of lime are in some pedons.

Other features--Few or common fine or medium relict mottles with chroma of 4 or 5 or soft masses of gypsum are in some pedons.

Macyflet Series

The Macyflet series consists of very deep, moderately well drained soils that formed in lacustrine deposits mainly from volcanic rocks. The Macyflet soils are on interplateau basins. Slopes are 0 to 2 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Very fine, montmorillonitic, frigid Vertic Paleargids

Typical pedon: Macyflet silty clay loam, in map unit 1010, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; light gray (10YR 7/2) silty clay loam, dark grayish brown (10YR 4/2) moist; weak thick platy structure; slightly hard, very friable, sticky and plastic; common fine roots; common medium, many fine and very fine vesicular pores; neutral (pH 7.0); abrupt smooth boundary.

A2--2 to 9 inches; light brownish gray (10YR 6/2) silty clay loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, sticky and plastic; common very fine, fine and medium roots; few fine tubular, and many very fine interstitial pores; neutral (pH 7.0); abrupt smooth boundary.

Bt1--9 to 15 inches; light brownish gray (10YR 6/2) crushed, clay, brown (10YR 4/3) moist; strong medium prismatic structure parting to moderate medium angular blocky; hard, very friable, very sticky and very plastic; few fine medium roots; common very fine interstitial pores, few fine and very fine tubular pores; many pressure faces; neutral (pH 7.0); abrupt smooth boundary.

Bt2--15 to 32 inches; pale brown (10YR 6/3) clay, brown (10YR 4/3) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; few fine and medium roots; very few fine tubular pores; many pressure faces; neutral (pH 7.0); gradual smooth boundary.

Bt3--32 to 47 inches; light yellowish brown (10YR 6/4) clay, olive brown (2.5Y 4/4) moist, with few fine distinct light olive brown (2.5Y 5/6) mottled manganese stains; strong fine angular blocky structure; very hard, very firm, very sticky and very plastic; very few roots; very few fine tubular pores; many pressure faces; slightly alkaline (pH 7.6); abrupt smooth boundary.

2C1--47 to 49 inches; white (10YR 8/1) loamy sand, light gray (10YR 7/1) moist; massive; hard, very friable, nonsticky and nonplastic; slightly alkaline (pH 7.6); abrupt smooth boundary.

2C2--49 to 60 inches; light gray (2.5Y 7/2) loamy fine sand, light brownish gray (2.5Y 6/2) moist, common fine prominent brownish yellow (10YR 6/8) mottles; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine interstitial pores; moderately alkaline pH 8.2).

Type location: Washoe County, Nevada; approximately 150 feet south of the Oregon state line and 150 feet east of road line in Macy Flat, about 2,500 feet west and 150 feet south of the northeast corner of section 17 and the Oregon state line, T. 47 N., R. 21 E.; (41 degrees, 59 minutes, 44 seconds north latitude and 119 degrees, 38 minutes, 41 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall. Saturated below 5 feet in most years, in the early spring. Aridic moisture regime bordering on Xeric.

Soil temperature: 43 to 47 degrees F.

Depth to base of Bt horizon: 30 to 60 inches.

Control section:

Clay content--60 to 70 percent.

Other features--Linear extensibility is 6 centimeters or more.

A horizons:

Value--6 or 7 dry; 3 through 5 moist.

Reaction--Slightly acid to slightly alkaline.

Bt1 and Bt2 horizons:

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 or 4, may be 2 in Bt1 horizon.

Clay content--60 to 70 percent.

Structure--Prismatic or columnar sometimes parting to angular blocky.

Consistence--Very hard or extremely hard dry, may be hard in Bt1 horizon.

Reaction--Slightly acid to slightly alkaline.

Other features--Common to many pressure faces.

Bt3 horizon:

Hue--10YR or 2.5Y moist.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 or 4.

Clay content--60 to 70 percent.

Structure--Angular blocky; some pedons have prismatic parting to angular blocky.

Consistence--Very hard or extremely hard dry.

Reaction--Slightly acid to slightly alkaline.

Other features--Common to many pressure faces.

2C horizons:

Hue--10YR or 2.5Y.

Texture--Loamy sand or loamy fine sand.

Clay content--0 to 10 percent.

Reaction--Mildly alkaline to strongly alkaline.

Other features--This layer when present is dominated by volcanic ash.

Madeline Series

The Madeline series consists of shallow, well drained soils that formed in residuum and colluvium from basalt, tuff and andesite. Madeline soils are on summits, crests, shoulders, and side slopes of plateaus, hills, and mountains. Slopes are 4 to 30 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid Lithic Argixerolls

Typical pedon: Madeline very cobbly loam, in map unit 1375, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 20 percent cobbles and 30 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) very cobbly loam, very dark brown (10YR 2/2) moist; moderate thin and medium platy structure; slightly hard, friable,

slightly sticky and slightly plastic; few very fine and fine roots; many very fine interstitial pores; 20 percent cobbles and 30 percent pebbles; neutral (pH 7.0); clear wavy boundary.

A2--2 to 6 inches; dark grayish brown (10YR 4/2) clay loam, very dark brown (10YR 2/2) moist; weak very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine tubular pores; 10 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt1--6 to 14 inches; dark brown (10YR 4/3) gravelly clay, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and very plastic; common very fine and few fine roots; many very fine tubular pores; many moderately thick clay films on faces of peds and in pores; 25 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt2--14 to 19 inches; yellowish brown (10YR 5/4) gravelly clay, brown (10YR 4/3) moist; strong fine and medium subangular blocky structure; hard, friable, very sticky and very plastic; common very fine and fine roots; many very fine tubular pores; 25 percent pebbles; many moderately thick clay films on faces of peds and in pores; neutral (pH 7.2); abrupt smooth boundary.

R--19 to 23 inches; hard basalt.

Type location: Washoe County, Nevada; about 400 feet east and 2,350 feet south of the northwest corner of section 18, T. 43 N., R. 19 E.; (41 degrees, 38 minutes, 56 seconds north latitude and 119 degrees, 54 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 43 to 47 degrees F.

Mollic epipedon thickness: 7 to 15 inches and includes part or all of argillic horizon.

Depth to bedrock: 10 to 20 inches.

Other features: 4 to 8 inch thick BA horizon is present in some pedons.

Control section:

Clay content--35 to 60 percent.

Rock fragments--5 to 35 percent.

A horizons:

Hue--5YR through 10YR moist and dry.

Value--4 or 5 dry, 2 or 3 moist. A thin subhorizon may be 6 dry and 4 moist.

Chroma--1 through 3 dry and moist.

Reaction--Slightly acid to slightly alkaline.

Bt1 horizons:

Hue--5YR through 10YR moist and dry.

Value--3 through 5 dry.

Chroma--2 or 3 moist and dry.

Texture--Sandy clay loam, sandy clay or clay loam with 25 to 40 percent clay.

Structure--Weak to strong, prismatic, subangular or angular blocky.

Consistence--Slightly hard to hard dry.

Reaction--Slightly acid to slightly alkaline.

Bt2 horizons:

Hue--5YR through 10YR moist and dry.
 Value--3 through 6 dry, 3 or 4 moist.
 Chroma--2 through 4 dry and moist.
 Texture--Clay, sandy clay or clay loam with 35 to 60 percent clay.
 Rock fragments--5 to 35 percent, cobbles, stones and pebbles.
 Structure--Weak to strong, prismatic, subangular or angular blocky.
 Consistence--Hard to extremely hard dry, friable to very firm moist.
 Reaction--Slightly acid to slightly alkaline.

Mahala Series

The Mahala series consists of moderately deep, well drained soils that formed in a thin loess mantle over residuum from tuff. Mahala soils are on side slopes of pediment remnants, plateau summits, hills and rock core areas of fan piedmont remnant side slopes. Slopes are 0 to 8 percent. The mean annual temperature is about 47 degrees F. and the mean annual precipitation is about 11 inches.

Taxonomic class: Fine, montmorillonitic, mesic Vertic Paleargids

Typical pedon: Mahala very cobbly silt loam, in map unit 1095, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 30 percent cobbles and 20 percent pebbles.

A1--0 to 3 inches; light brownish gray (10YR 6/2) very cobbly silt loam, very dark grayish brown (10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, sticky and plastic; many very fine roots; many very fine vesicular pores; 30 percent cobbles and 20 percent pebbles; neutral (pH 7.3); clear wavy boundary.

A2--3 to 7 inches thick; brown (10YR 5/3) cobbly silt loam, very dark grayish brown (10YR 3/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and common fine roots; many very fine tubular pores; 10 percent cobbles, 15 percent pebbles; neutral (pH 7.3); abrupt wavy boundary.

2Bt1--7 to 10 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 4/3) moist; strong fine and medium subangular blocky structure; very hard, very friable, very sticky and very plastic; common very fine and fine and few medium roots; many very fine tubular pores; common thin and few moderately thick dark grayish brown (10YR 4/2) clay films, very dark brown (10YR 2/2) moist on faces of peds and in pores; 20 percent pebbles; many pressure faces; slightly alkaline (pH 7.6); abrupt wavy boundary.

2Bt2--10 to 19 inches; brown (10YR 5/3) clay, dark yellowish brown (10YR 4/4) moist; strong medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; common very fine and few fine roots; few

very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; many pressure faces; slightly alkaline (pH 7.6); clear wavy boundary.

2Btk--19 to 23 inches; light yellowish brown (10YR 6/4) gravelly clay, yellowish brown (10YR 5/4) moist; moderate fine and medium angular blocky structure; very hard, firm, very sticky and very plastic; common very fine roots; few very fine tubular pores; 15 percent pebbles; many moderately thick clay films coating sand grains and on faces of peds; lime is disseminated; slightly effervescent; slightly alkaline (pH 7.8); abrupt wavy boundary.

2Cr--23 to 27 inches; very pale brown (10YR 8/3) weathered tuff, light yellowish brown (10YR 6/4) moist; thick platy in upper 2 inches; strongly effervescent lime coats on some plates; many very fine roots in horizontal mat at upper boundary; common thin and moderately thick clay films on plates in upper 2 inches.

Type location: Washoe County, Nevada; about 700 feet south and 1,200 feet east of the northwest corner of section 35, T. 43 N., R. 18 E.; (41 degrees, 36 minutes, 36 seconds north latitude and 119 degrees, 56 minutes, 25 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 50 degrees F.

Depth to carbonates: 14 to 30 inches.

Solum thickness and depth to weathered bedrock: 20 to 40 inches.

Other features: Abrupt clay increase of 15 percent or more within a vertical distance of 1 inch or less between the A and Bt horizon. Linear extensibility is 6 centimeters or more.

Control section:

Clay content--40 to 60 percent average.

Rock fragments--0 to 20 percent mainly pebbles.

Reaction: Neutral through moderately alkaline, normally increasing with depth.

A horizons:

Value--5 through 7 dry, 3 or 4 moist.

Chroma--1 through 3.

Other features--Some pedons have thin AB horizons.

Other features--Commonly has bleached sand grains and common fine distinct iron mottles.

Bt horizons:

Value--5 or 6 dry, 4 through 6 moist.

Chroma--2 through 4 dry, 3 or 4 moist.

Texture--Clay or gravelly clay.

Structure--Weak through strong, medium to coarse prismatic, or columnar weak or moderate fine to coarse subangular or angular blocky or prismatic parting to angular or subangular blocky.

Other features--Bleached sand grains commonly cap prisms. Stress surfaces are common to many in some part of most pedons.

Btk horizon:

Value--6 or 7 dry, 5 or 6 moist.

Chroma--2 through 4.

Texture--Clay or clay loam with gravelly clay loam, or silty clay loam common in some pedons.

Reaction--Slightly alkaline or moderately alkaline.

Secondary lime accumulation--Disseminated but may include filaments or threads in some pedons.

Cr horizon:

Other features--Few or common, fine or medium, lime coats or soft masses or threads on fracture planes.

Effervescence--Noneffervescent to slightly effervescent, may be strongly effervescent in areas of visible carbonate accumulation.

Mazuma Series

The Mazuma series consists of very deep, well drained soils that formed in alluvium and lacustrine materials from mixed rock sources. Mazuma soils are on lake plain terraces, lagoons, beach plains, alluvial flats, fan skirts, lagoons, and stream terraces. Slopes are 0 to 4 percent. The mean annual precipitation is about 6 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Coarse-loamy, mixed (calcareous), mesic Typic Torriorthents

Typical pedon: Mazuma fine sandy loam, in map unit 1210, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; very pale brown (10YR 7/3) fine sandy loam, brown (10YR 4/3) moist; strong medium and thick platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine and fine vesicular pores; 10 percent 2 to 5 millimeter pebbles; slightly effervescent; strongly alkaline (pH 8.8); abrupt smooth boundary.

A2--2 to 6 inches; light gray (2.5Y 7/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; moderate thick platy structure; slightly hard, very friable, nonsticky and nonplastic; few fine roots; many very fine and common fine vesicular pores; slightly effervescent; strongly alkaline (pH 9.0); abrupt smooth boundary.

Bk--6 to 15 inches; light gray (10YR 7/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; weak coarse subangular blocky structure; slightly hard, very friable; nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine tubular pores; strongly effervescent; few fine soft masses of lime; strongly alkaline (pH 9.0); clear smooth boundary.

C1--15 to 28 inches; light gray (2.5Y 7/2) fine sandy loam and sandy loam, olive brown (2.5Y 4/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; common very fine tubular pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

C2--28 to 36 inches; light gray (2.5Y 7/2) stratified fine sandy loam and sandy loam, olive brown (2.5Y 4/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; few very fine tubular pores; 10 percent 2 to 5 millimeter pebbles; violently

effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

C3--36 to 51 inches; light gray (2.5Y 7/2) stratified very fine sandy loam and sandy loam, olive brown (2.5Y 4/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many fine and very fine interstitial pores; violently effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

C4--51 to 62 inches; light gray (2.5Y 7/2) gravelly sandy loam, olive brown (2.5Y 4/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 15 percent 2 to 5 millimeter pebbles and 5 percent 5 millimeter to 1 centimeter pebbles; violently effervescent; very strongly alkaline (pH 9.6).

Type location: Washoe County, Nevada; about 0.7 miles east of the Nevada-California state line on the east side of Surprise Valley; about 75 feet east of main road on north side of trail; about 350 feet east and 650 feet north of the southwest corner of section 16, T. 41 N., R. 18 E.; (41 degrees, 28 minutes, 07 seconds north latitude and 119 degrees, 59 minutes, 04 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in the winter and spring, dry from summer to mid fall.

Soil temperature: 53 to 57 degrees F.

Control section:

Clay content--5 to 15 percent.

Rock fragments--A few strata have up to 25 percent pebbles.

A horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry; 4 through 6 moist.

Chroma--2 through 4.

Reaction--Moderately alkaline to very strongly alkaline.

Electrical conductivity--0 to 4 millimhos

SAR--1 to 5

Bk horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry; 4 through 6 moist.

Chroma--2 through 4.

Structure--Subangular blocky or it is massive.

Electrical conductivity--4 to 16 millimhos

SAR--13 to 45

Other features--Less than 3 percent calcium carbonate equivalent.

Consistence--Slightly hard or hard, dry.

C horizons:

Hue--10YR or 2.5Y

Value--5 through 7 dry; 4 through 6 moist.

Chroma--2 through 4.

Texture--Stratified sandy loam, fine sandy loam, very fine sandy loam and silt loam with some pedons containing thin strata of clay loam and strata up to 12 inches thick of coarse sand, very coarse sand, fine sand or loamy sand.

Reaction--Moderately alkaline to very strongly alkaline.
Electrical conductivity--4 to 16 millimhos
SAR--13 to 45

Segregated lime--Few fine or medium calcium carbonate concretions may be in any horizon.

Unconformable material--Lacustrine silts and clays occur below 40 inches in some pedons.

Other features--Salt crystals and relict mottles are in some pedons in the lower C horizon.

Structure--Subangular blocky, platy or is single grain or massive.

Consistence--Soft or slightly hard, dry or is loose.

moist; single grain; loose, nonsticky and nonplastic; few fine roots; many very fine and fine, and few medium interstitial pores; continuous lime coatings on the undersides, and some lime on the top and sides of pebbles; 75 percent pebbles; violently effervescent; strongly alkaline (pH 9.0); clear wavy boundary.

4C--30 to 60 inches; grayish brown (10YR 5/2) coarsely stratified coarse sand and gravel, dark grayish brown (10YR 4/2) moist; many very dark gray (10YR 3/1), white (10YR 8/1) and brown (10YR 4/3) pebbles and sand grains; single grain; loose, nonsticky and nonplastic; few fine roots; many very fine and fine, and few medium interstitial pores; slightly effervescent; strongly alkaline (pH 9.0).

McConnel Series

The McConnel series consists of very deep, somewhat excessively drained soils that formed in alluvium from mixed rock sources with a component of loess and volcanic ash over lacustrine beach sediments or gravelly alluvium. McConnel soils are on inset fans, fan aprons, beach plains, beach terraces, fan skirts, drainage channel, barrier bars, and offshore bars. Slopes are 2 to 8 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Sandy-skeletal, mixed, mesic Xeric Haplocambids

Typical pedon: McConnel gravelly fine sandy loam, in map unit 1121, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inch; light brownish gray (2.5Y 6/2) gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak thick platy structure; slightly hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine and fine vesicular pores; 20 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

A2--2 to 5 inches; light brownish gray (10YR 6/2) gravelly fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine and fine interstitial pores; 20 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bw--5 to 15 inches; light brownish gray (10YR 6/2) fine sandy loam, dark brown (10YR 4/3) moist; weak very fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine and fine interstitial pores; 5 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

2Bk1--15 to 20 inches; grayish brown (10YR 5/2) very gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine and fine interstitial pores; common very thin lime coatings on the underside of pebbles; slightly effervescent; 50 percent pebbles; moderately alkaline (pH 8.0); clear wavy boundary.

3Bk2--20 to 30 inches; grayish brown (10YR 5/2) extremely gravelly coarse sand, dark gray (10YR 4/1)

Type location: Washoe County, Nevada; about 0.25 miles east of the Nevada-California state line on the east side of Surprise Valley; about 1,400 feet east and 2,600 feet south of the northwest corner of section 17, T. 42 N., R. 18 E.; (41 degrees, 33 minutes, 38 seconds north latitude and 119 degrees, 59 minutes, 34 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 50 to 54 degrees F.

Depth to 2Bk1 horizon: 10 to 20 inches.

Control section:

Clay content--Averages up to 5 percent.

Rock fragments--Averages 50 to 80 percent, mainly pebbles.

A horizons:

Hue--10YR or 2.5Y.

Value--5 or 6 dry, 3 or 4 moist (5 dry and 3 moist only in the upper 3 inches).

Chroma--1 through 3.

Reaction--Neutral to moderately alkaline.

Bw horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 5 moist.

Chroma--2 through 4 (1 if dark sand grains are present).

Texture--Loam, sandy loam, fine sandy loam.

Structure--Very fine to medium granular or subangular blocky or it is massive.

Reaction--Neutral to moderately alkaline.

Bk and C horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 6 moist.

Chroma--2 through 4 (1 if dark sand grains are present).

Texture--Stratified very gravelly sandy loam to extremely gravelly coarse sand.

Structure--Single grain or massive, subangular or blocky in subhorizons of some pedons.

Consistence--Loose to slightly hard, dry, loose to friable moist.

Reaction--Slightly alkaline to very strongly alkaline.

Calcium carbonate equivalent--Less than 5 percent.

McWatt Series

The McWatt series consists of deep, somewhat excessively drained soils that formed in mixed alluvium. The McWatt soils are on beach terraces. Slopes are 8 to 30 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Sandy-skeletal, mixed, mesic Xeric Haplocambids.

Typical pedon: McWatt extremely stony fine sandy loam, in map unit 1135, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 4 inches; pale brown (10YR 6/3) extremely stony fine sandy loam, dark brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine vesicular pores; 15 percent stones, 20 percent cobbles and 30 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--4 to 10 inches; light brownish gray (10YR 6/2) extremely cobbly fine sandy loam, dark brown (10YR 3/3) moist; strong medium subangular blocky structure; slightly hard, very friable, sticky and slightly plastic; many very fine and common fine roots; many very fine tubular pores; 15 percent stones, 20 percent cobbles and 30 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bw--10 to 20 inches; pale brown (10YR 6/3) extremely gravelly fine sandy loam, dark brown (10YR 3/3) moist; weak coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine, common fine and medium roots; many very fine interstitial pores; 3 percent stones, 20 percent cobbles and 50 percent pebbles; neutral (pH 7.2); clear irregular boundary.

2Cqk1--20 to 25 inches; light yellowish brown (10YR 6/4) extremely cobbly loamy sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; many very fine and fine, common medium and few coarse roots; many very fine interstitial pores; 10 percent stones, 35 percent cobbles and 40 percent pebbles; 30 percent of underside of rock fragments have less than 0.5 millimeter thick silica and lime coats; slightly alkaline (pH 7.6); clear irregular boundary.

2Cqk2--25 to 44 inches; light yellowish brown (10YR 6/4) extremely gravelly sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine, few medium and coarse roots; many very fine interstitial pores; 5 percent stones, 15 percent cobbles and 50 percent pebbles; 60 percent of underside of rock fragments have less than 0.5 millimeter thick lime and silica coats; slightly alkaline (pH 7.6); abrupt irregular boundary.

R--44 to 53 inches; Hard massive vesicular basalt with silica and lime coats in some fractures.

Type location: Washoe County, Nevada. About 3.5 miles south of Road 8A along power line in Long Valley in an unsectioned area, T. 42 N., R. 20 E.; (41 degrees, 31 minutes, 59 seconds north latitude and 119 degrees, 44 minutes, 32 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October.

Soil temperature: 47 to 53 degrees F.

Depth to sandy-skeletal layer: 15 to 26 inches.

Depth to bedrock: 40 to 60 inches.

Control section--Clay content--2 to 8 percent.

Rock fragments--60 to 75 percent stones, cobbles and pebbles, when mixed.

Depth to secondary lime accumulation--17 to 29 inches. Lime accumulation occur as coatings on rock fragments.

A horizons:

Hue--10YR or 2.5Y

Reaction--Neutral or slightly alkaline.

Organic matter--1 to 2 percent.

Bw horizon:

Value--6 or 7 dry, 3 through 5 moist

Chroma--3 or 4

Clay content--8 to 15 percent

Texture--Extremely gravelly fine sandy loam or very gravelly sandy loam.

Reaction--Neutral or slightly alkaline.

2Cqk horizons:

Value--5 through 7 dry, 3 through 5 moist

Chroma--3 or 4

Clay content--0 to 2 percent

Texture--Extremely cobbly or extremely gravelly sand or loamy sand.

Rock fragments--60 to 80 percent stones, cobbles and pebbles.

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Noneffervescent matrix. Few to many less than 0.5 millimeter thick lime and silica coats on underside of rock fragments.

Calcium carbonate equivalent--1 to 3 percent.

Menbo Series

The Menbo series consists of moderately deep well drained soils that formed in residuum and colluvium derived from volcanic rocks. The Menbo soils are on plateau shoulder slopes and side slopes. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey-skeletal, montmorillonitic, frigid Pachic Argixerolls.

Typical pedon: Menbo very gravelly loam, in map unit 1256, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, friable, sticky and plastic; many very fine roots; many very fine tubular pores; 50 percent pebbles; slightly acid (pH 6.5); abrupt wavy boundary.

A2--2 to 7 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine and fine and common medium roots; many very fine tubular pores; 30 percent pebbles; neutral (pH 6.6); clear wavy boundary.

2Bt1--7 to 14 inches; dark grayish brown (10YR 4/2) very gravelly clay loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine and common fine tubular pores; 40 percent pebbles; few thin clay films on faces of peds and in pores; neutral (pH 6.6); clear wavy boundary.

2Bt2--14 to 21 inches; brown (7.5YR 5/3) very gravelly clay, dark brown (7.5YR 3/3) moist; moderate fine and medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; common very fine and fine and few medium and coarse roots; common very fine tubular pores; many thin and moderately thick dark brown (7.5YR 4/2) clay films, dark brown (7.5YR 3/2) moist on faces of peds and in pores; 15 percent cobbles, 30 percent pebbles; neutral (pH 7.0)--gradual smooth boundary.

2Bt3--21 to 34 inches; brown (7.5YR 5/4) very gravelly clay, dark brown (7.5YR 4/4) moist; weak fine and medium prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; few very fine and fine roots; few very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; 15 percent cobbles, 30 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Cr--34 to 36 inches; hard tuff.

Type location: Washoe County, Nevada; about 1,600 feet east and 1,800 feet south of the northwest corner of section 23, T. 46 N., R. 19 E.; (41 degrees, 53 minutes, 45 seconds north latitude and 119 degrees, 49 minutes, 21 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 47 degrees F.

Mollic epipedon thickness: 20 to 35 inches.

Depth to bedrock: 20 to 40 inches.

Control section:

Clay content--35 to 50 percent when mixed.

Rock fragments--35 to 50 percent pebbles and cobbles.

A horizons:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Reaction--Slightly acid or neutral

2Bt horizons:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 3 or 4 moist.

Chroma--2 through 4.

Texture--Clay loam or clay.

Clay content--35 to 50 percent

Rock fragments--15 to 30 percent cobbles and 20 to 40 percent pebbles.

Mesman Series

The Mesman series consist of very deep well drained soils that formed in mixed lacustrine sediments. The Mesman soils are on lake terraces. Slopes are 0 to 5 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Xeric Natrargids

Typical pedon: Mesman fine sandy loam in map unit 1115, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; light brownish gray (10YR 6/2) fine sandy loam, dark brown (10YR 4/3) moist; strong thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine tubular and vesicular pores; slightly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Btn--4 to 9 inches; pale brown (10YR 6/3) sandy clay loam, dark brown (10YR 4/3) moist; weak fine prismatic structure parting to strong fine and medium subangular blocky; hard, friable, sticky and plastic; few very fine and fine roots; common very fine tubular pores; many thin clay films on faces of peds and in pores; slightly effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

Btkn--9 to 13 inches; pale brown (10YR 6/3) clay loam, dark yellowish brown (10YR 4/4) moist; strong fine and medium subangular blocky structure; hard, friable, very sticky and very plastic; few fine and medium roots; common very fine tubular pores; many moderately thick clay films on faces of peds and in pores; strongly effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

Bkn1--13 to 22 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; strong fine and medium subangular blocky structure; hard, friable, sticky and plastic; common fine roots; common very fine tubular pores; few thin clay films in pores and bridges; strongly effervescent; moderately alkaline (pH 8.2); clear wavy boundary.

Bkn2--22 to 29 inches; very pale brown (10YR 7/3) very fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few

very fine roots; common very fine tubular pores; common medium soft masses of lime; violently effervescent; moderately alkaline (pH 8.0); clear smooth boundary.

- Bkn3--29 to 36 inches; very pale brown (10YR 7/3) silt loam, dark brown (10YR 4/3) moist; massive; slightly hard, very friable, sticky and plastic; few very fine roots; common very fine tubular pores; common medium soft masses of lime; slightly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.
- C--36 to 60 inches; pale brown (10YR 6/3) very fine sandy loam and loam, dark brown (10YR 4/3) moist; massive; hard, very friable, slightly sticky and slightly plastic; common very fine tubular pores; slightly effervescent; moderately alkaline (pH 8.2).

Type location: Washoe County, Nevada; in Coleman Valley near the Nevada-Oregon state line; about 600 feet west and 100 feet south of the northeast corner of section 13, T. 47 N., R. 19 E.; (41 degrees, 59 minutes, 50 seconds north latitude and 119 degrees, 47 minutes, 31 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October.

Soil temperature: 47 to 50 degrees F.

Control section:

Clay content--18 to 35 percent

Sand content--25 to 50 percent, mainly very fine and fine sand

Effervescence: Slightly effervescent to violently effervescent.

A horizon:

Value--5 thru 7 dry, 3 or 4 moist

Btn and Btnk horizons:

Value--5 or 6 dry, 3 or 4 moist

Texture--Loam, sandy clay loam or clay loam

SAR--25 to 70

Bkn and C horizons:

Value--5 through 7 dry, 3 or 4 moist

Chroma--2 or 3

Texture--Very fine sandy loam, loam or silt loam

SAR--13 to 70

Millerlux Series

The Millerlux series consists of shallow, well drained soil that formed in residuum and colluvium from basalt and tuff with a minor component of loess. Millerlux soils are on the tops of basaltic plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid Lithic Xeric Haplargids

Typical pedon: Millerlux very cobbly loam, in map unit 1240, rangeland. (Colors are for dry soils unless otherwise noted). The soil surface is covered with 25 percent cobbles and 20 percent pebbles.

A--0 to 4 inches; light brownish gray (10YR 6/2) very cobbly loam, dark brown (10YR 3/3) moist; strong thin and medium platy structure; hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine vesicular pores; 25 percent cobbles and 20 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--4 to 8 inches; pale brown (10YR 6/3) clay, dark brown (10YR 3/3) moist; strong very fine and fine angular blocky structure; hard, very friable, very sticky and very plastic; many very fine roots; many very fine tubular pores; many moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bt2--8 to 12 inches; light yellowish brown (10YR 6/4) clay, dark yellowish brown (10YR 4/4) moist; strong fine and medium angular blocky structure; hard, very friable, very sticky and very plastic; common very fine and few fine roots; few very fine tubular pores; many moderately thick brown (10YR 4/3) clay films, very dark grayish brown (10YR 3/2) moist on faces of peds and in pores; slightly alkaline (pH 7.6); clear wavy boundary.

Btk--12 to 15 inches; light yellowish brown (10YR 6/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; strong medium angular blocky structure; hard, very friable, very sticky and very plastic; few very fine roots; few very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 20 percent pebbles; lime is disseminated; slightly effervescent; moderately alkaline (pH 8.0); clear irregular boundary.

2R--15 to 19 inches; hard tuff with few thin white (10YR 8/1) lime coatings on its surface.

Type location: Washoe County Nevada; about 900 feet west and 1,700 feet south of the northeast corner of section 10, T. 43 N., R. 18 E.; (41 degrees, 39 minutes, 53 seconds north latitude and 119 degrees, 56 minutes, 52 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 43 to 47 degrees F.

Depth to bedrock: 12 to 20 inches.

A horizon:

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Usually neutral or slightly alkaline, but is moderately alkaline in some pedons.

Bt horizons:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 through 5 moist.

Chroma--3 through 6, but may be 2 dry in upper part.

Clay content--40 to 60 percent.

Structure--Fine to coarse prismatic or angular blocky.

Consistence--Hard or extremely hard, dry; firm to extremely firm, moist; sticky or very sticky and plastic or very plastic, wet.
 Rock fragments--0 to 15 percent, mainly pebbles.
 Reaction--Neutral to moderately alkaline.

Btk horizon:

Hue--10YR Or 7.5YR.
 Value--5 or 6 dry, 4 or 5 moist.
 Chroma--3 or 4.
 Texture--Clay or clay loam.
 Clay content--35 to 50 percent.
 Rock fragments--10 to 30 percent, mainly pebbles.
 Structure--Prismatic or angular blocky.
 Reaction--Moderately alkaline to strongly alkaline.

Nellspring Series

Nellspring series consists of moderately deep to duripan, well drained soils formed in alluvium from volcanic rocks. The Nellspring soils are fan piedmont remnant summits. Slopes are 2 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Vertic Argidurids.

Typical pedon: Nellspring very gravelly fine sandy loam, in map unit 1412, rangeland (Colors are for dry soil unless otherwise noted.) The soil surface is covered with about 5 percent cobbles and 45 percent pebbles.

A--0 to 3 inches; light brownish gray (10YR 6/2) very gravelly fine sandy loam, dark grayish brown (10YR 4/2) moist; strong thick platy structure; hard, friable, nonsticky and nonplastic; few very fine roots; many very fine and fine vesicular pores; 5 percent cobbles and 45 percent pebbles; neutral (pH 7.2); abrupt wavy boundary.

Btss1--3 to 12 inches; light brown (7.5YR 6/4) clay, dark reddish brown (5YR 3/4) moist; strong fine prismatic structure parting to strong fine angular blocky; very hard, friable, very sticky and very plastic; common very fine and few medium sized roots; common very fine tubular pores; many moderately thick clay films on faces of peds and lining pores; vertical cracks 8 millimeters to 1 centimeter wide and 3 to 4 inches apart extend from a depth of 3 to 12 inches; common slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; neutral (pH 7.3); clear wavy boundary.

Btss2--12 to 18 inches; reddish brown (5YR 5/4) clay, yellowish red (5YR 4/6) moist; strong fine prismatic structure parting to strong fine angular blocky; very hard, friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; vertical cracks 8 millimeters to 1 centimeter wide and 4 to 6 inches apart are present; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; slightly alkaline (pH 7.5); clear wavy boundary.

Btk--18 to 35 inches; light brown (7.5YR 6/4) clay loam, brown (7.5YR 4/4) moist; strong fine and medium angular blocky structure; very hard, friable, sticky and plastic; few very fine roots; common very fine tubular pores; many moderately thick and thick clay films on faces of ped and lining pores; common fine soft filaments of lime; moderately alkaline (pH 8.0); abrupt wavy boundary.

Bqkm1--35 to 41 inches; strongly silica/lime cemented duripan; strong thin and medium platy structure; extremely hard, extremely firm; alternate medium horizontal plates with discontinuous laminar cap; horizontal root mat at upper boundary with many very fine, fine and few medium roots; 5 percent cobbles, 15 percent pebbles; violently effervescent; moderately alkaline (pH 8.3); gradual smooth boundary.

Bqkm2--41 to 60 inches; strongly silica and lime cemented duripan; alternating layers of strongly and weakly cemented material; extremely hard and hard, extremely firm and firm; 5 percent cobbles, 15 percent pebbles; violently effervescent; moderately alkaline (pH 8.3).

Type location: Washoe County, Nevada. About 5 miles northeast of Nellie Spring Mountain and about 1 mile east of Grassy Camp; about 2,100 feet south and 1,300 feet west of the northeast corner of section 19, T. 41 N., R. 22 E.; (41 degrees, 27 minutes, 05 seconds north latitude and 119 degrees 32 minutes, 28 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 20 to 40 inches

Control section:

Clay content--40 to 60 percent

Rock fragments--0 to 15 percent.

A horizon:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--2 or 3

Btss and Btk horizons:

Hue--10YR, 7.5YR or 5YR.

Value--4 through 6 dry, 3 or 4 moist

Chroma--4 through 6

Clay content--50 to 60 percent in the upper part; 35 to 50 percent in the lower part; when mixed, 40 to 60 percent.

Texture--Clay or clay loam

Rock fragments--0 to 15 percent.

Consistence--Hard through extremely hard dry, friable through very firm moist.

Reaction--Neutral or slightly acid in the upper part, slightly or moderately alkaline in the lower part.

Effervescence--Noneffervescent in Bt horizons; strongly or violently effervescent in the Btk horizon, with few or common fine or medium soft filaments or masses of lime in the lower part.

Other features: Vertical cracks 5 to 25 millimeters wide, few to common slickensides and wedge-shaped aggregates. A clay increase of 35 to 50 percent

occurs within a vertical distance of 1 inch between the A and Bt horizons.

Newlands Series

The Newlands series consists of deep, well drained soils that formed in residuum and local colluvium from basic rocks. Newlands soils are on mountain, plateau or foothill toe and side slopes. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and mean annual air temperature is about 44 degrees F.

Taxonomic class: Fine-loamy, mixed Argic Cryoborolls

Typical pedon: Newlands stony loam, in map unit 1257, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 1 percent stones, 5 percent cobbles, and 15 percent pebbles.

A1--0 to 2 inches; brown (10YR 5/3) stony loam, very dark brown (10YR 2/2) moist; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 1 percent stones, 5 percent cobbles and 15 percent pebbles; slightly acid (pH 6.2); clear wavy boundary.

A2--2 to 6 inches; grayish brown (10YR 5/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and and common fine roots; many very fine tubular pores; 5 percent cobbles and 15 percent pebbles; slightly acid (pH 6.4); clear smooth boundary.

Bt1--6 to 12 inches; brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, sticky and plastic; many very fine and common fine roots; many very fine tubular pores; few thin clay films on faces of peds and in pores; 10 percent pebbles; slightly acid (pH 6.4); clear wavy boundary.

Bt2--12 to 27 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium and coarse roots; many very fine tubular pores; many thin clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt3--27 to 36 inches; light brown (7.5YR 6/4) gravelly clay loam, dark brown (7.5YR 4/4) moist; moderate coarse and medium subangular blocky structure; hard, very friable, sticky and plastic; common very fine and few fine roots; many very fine tubular pores; common moderately thick clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

BCt--36 to 41 inches; light brown (7.5YR 6/4) gravelly clay loam, dark brown (7.5YR 4/4) moist; moderate coarse subangular blocky structure; hard, very friable, sticky and plastic; few very fine and fine roots; many very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 20 percent pebbles

and 5 percent cobbles; neutral (pH 7.0); abrupt irregular boundary.

R--41 to 45 inches; hard andesite with common moderately thick clay films in some fractures in upper 2 inches.

Type location: Washoe County, Nevada; about 200 feet west and 900 feet south of the northeast corner of section 17, T. 46 N., R. 19 E.; (41 degrees, 54 minutes, 48 seconds north latitude and 119 degrees, 52 minutes, 04 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry in late summer and fall.

Soil temperature: MAST--41 to 45 degrees F.

Average summer soil temperature: 56 to 59 degrees F.

Thickness of mollic: 12 to 16 inches and includes part of the argillic

Depth to bedrock: 40 to 60 inches

Control section:

Clay content--27 to 35 percent

Reaction--Slightly acid or neutral

A horizons:

Hue--10YR or 5YR

Value--4 or 5 dry, 3 or 4 moist

Chroma--1 through 3, chroma of 1 occurs only in the A1 horizon

Bt horizons:

Hue--10YR, 7.5YR or 5YR

Value--5 or 6 dry, 3 through 5 moist

Chroma--3 or 4

Texture--Clay loam or sandy clay loam modified by 5 to 35 percent pebbles and a few cobbles

Structure--Moderate or strong, fine to coarse subangular blocky or angular blocky or weak or moderate fine or medium prismatic

Ninemile Series

The Ninemile series consists of shallow, well drained soils that formed in residuum and colluvium from andesite, rhyolite, basalt and welded tuffs with admixtures of volcanic ash. The Ninemile soils are on hill plateau and mountain side slopes, shoulders, and summits. Slopes are 2 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Clayey, montmorillonitic, frigid Lithic Argixerolls

Typical pedon: Ninemile very cobbly loam, in map unit 1180, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 20 percent cobbles and 30 percent pebbles.

A1--0 to 2 inches; dark brown (10YR 4/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure; slightly hard, friable,

slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 25 percent cobbles, 30 percent pebbles; slightly acid (pH 6.4); abrupt smooth boundary.

A2--2 to 7 inches; dark brown (10YR 4/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine interstitial pores; 35 percent pebbles and 20 percent cobbles; slightly acid (pH 6.4); abrupt smooth boundary.

Bt1--7 to 11 inches; brown (10YR 5/3) gravelly clay, dark brown (10YR 3/3) moist; moderate very fine subangular blocky structure; hard, friable, very sticky and very plastic; many very fine and fine, and few medium roots; many very fine interstitial pores; continuous thin clay films on faces of peds; 30 percent pebbles and 5 percent cobbles; neutral (pH 6.8); abrupt wavy boundary.

Bt2--11 to 19 inches; light yellowish brown (10YR 6/4) clay, dark yellowish brown (10YR 4/4) moist; strong fine and medium subangular blocky structure; extremely hard, extremely firm, very sticky and very plastic; few very fine and fine roots; very few tubular pores; many thick clay films on faces of peds and in pores; neutral (pH 6.6); abrupt irregular boundary.

R--19 to 23 inches; basalt.

Type location: Washoe County, Nevada; about 1,500 feet east and 1,000 feet south of the northwest corner of section 28, T. 46 N., R. 19 E.; (41 degrees, 53 minutes, 01 second north latitude and 119 degrees, 51 minutes, 42 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 47 degrees F.

Depth to bedrock: 10 to 20 inches.

Mollic epipedon: 6 to 18 inches; commonly includes part or all of the argillic horizon. (Mixed to 7 inches will be mollic)

Control section:

Clay content--Averages 40 to 60 percent.

Rock fragments--0 to 35 percent

A horizons:

Hue--10YR or 7.5YR

Value--3 through 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Reaction--Slightly acid to moderately alkaline.

Other features--Surface 1 or 2 inches of some pedons have color value of 6 and are massive.

Bt horizons:

Hue--5YR, 7.5YR or 10YR.

Value--3 through 6 dry, 2 through 4 moist.

Chroma--2 through 4, lower subhorizons have chroma of 6 in some pedons.

Clay content--Typically 40 to 60 percent. Some subhorizons range to 35 percent.

Texture--Clay or gravelly clay, but some subhorizons range to clay loam.

Rock fragments--0 to 30 percent pebbles or cobbles.

Structure--Moderate or strong subangular or angular blocky or prismatic. Bt3 horizons may be massive in some pedons.

Reaction--Neutral to moderately alkaline.

Consistence--Hard to extremely hard dry.

Other features--Some pedons are slightly hard dry, friable to firm moist; sticky and plastic wet in the Bt1 horizon.

R horizon:

Other features--In some pedons, where bedrock is less than 15 inches deep, the upper 1 to 3 inches of bedrock is weathered.

Nitpac Series

Nitpac series consists of moderately deep to duripan well drained soils that formed in colluvium and alluvium from basalt and andesite. The Nitpac soils are on interplateau side slopes. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Vertic Durixerolls

Typical pedon: Nitpac very cobbly loam, in map unit 1173, rangeland. (Colors are for dry soil unless otherwise noted). The soil surface is partially covered with 1 percent stones, 15 percent cobbles, and 20 percent pebbles.

A1--0 to 3 inches; brown (10YR 5/3) very cobbly loam, very dark grayish brown (10YR 3/2) moist; strong thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine vesicular pores; 1 percent stones; 15 percent cobbles and 20 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

A2--3 to 8 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate medium and thick platy structure; slightly hard, very friable, sticky and plastic; common very fine and few fine roots; many very fine vesicular and interstitial pores; 10 percent cobbles, 30 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--8 to 14 inches; brown (7.5YR 5/3) clay, dark brown (7.5YR 3/3) moist; moderate medium prismatic structure parting to strong medium angular blocky; very hard, friable, very sticky and very plastic; common very fine and few fine, medium and coarse roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; vertical cracks 5 millimeters to 1 centimeter wide and 1 to 2 inches apart extend from a depth of 8 to 14 inches; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 1 percent cobbles and 10 percent pebbles; neutral (pH 7.2); abrupt wavy boundary.

Bt2--14 to 21 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; strong fine and medium prismatic structure parting to strong medium and coarse angular

blocky; very hard, firm, very sticky and very plastic; common very fine and few fine roots; common very fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; vertical cracks 5 millimeters to 15 millimeters wide and 2 to 3 inches apart extend from a depth of 14 to 21 inches; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 10 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bt3--21 to 26 inches; light yellowish brown (10YR 6/4) gravelly clay loam, brown (7.5YR 5/4) moist; strong fine and medium angular blocky structure; very hard, friable, very sticky and very plastic; few very fine roots; common very fine and few fine tubular pores; many thin and moderately thick clay films on faces of ped and lining pores; 20 percent pebbles; slightly alkaline (pH 7.6); abrupt wavy boundary.

Bqm--26 to 34 inches; reddish yellow (7.5YR 7/6) strongly silica cemented duripan reddish yellow (7.5YR 6/8) moist; strong medium and thick platy structure; extremely hard, extremely firm; horizontal root mat at upper boundary with many very fine, fine and few medium roots; common very pale brown (10YR 7/4) silica laminae on tops of plates, yellowish brown (10YR 5/4) moist; clear smooth boundary.

Cr--34 to 40 inches; fractured basalt with silica in some fractures

Type location: Washoe County, Nevada. About 2 miles west of Long Valley and 1.5 miles northwest of Button Brush Flat in an unsectioned area, T. 41 N., R. 19 E.; (41 degrees, 28 minutes, 58 seconds north latitude and 119 degrees 51 minutes, 23 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October.

Soil temperature: 47 to 51 degrees F.

Thickness of mollic: 10 to 20 inches and includes the upper part of the argillic.

Depth to duripan: 20 to 40 inches

Depth to bedrock: 24 to 40 inches

Control section:

Clay content--40 to 60 percent

Rock fragments--10 to 15 percent, mainly pebbles when mixed.

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Value of 6 only in upper 2 inches.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Hue--10YR or 7.5YR

Value--4 through 6 dry, 3 through 5 moist.

Chroma--2 through 6

Clay content--40 to 60 percent when mixed. 45 to 60 percent in the upper part, 35 to 45 percent in the Bt3 when present.

Consistence--Hard to extremely hard dry, very friable to very firm moist.

Reaction--Neutral or slightly alkaline.

Other features--Vertical cracks 5 to 30 millimeters wide, few to common slickensides and wedge-shaped aggregates. A clay increase of 25 to 35 percent occurs within a vertical distance of 1 inch between the A and Bt horizons.

Nutzan Series

The Nutzan series consists of moderately deep, well drained soils formed in residuum and colluvium from rhyolitic tuff and pyroclastic rocks. The Nutzan soils are on plateau shoulder and side slopes. Slopes are 4 to 30 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Ashy-skeletal, frigid Vitritorrandic Haploxerolls.

Typical pedon: Nutzan gravelly sandy loam, in map unit 1279, rangeland (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent pyroclastic, 10 percent obsidian, and 10 percent rhyolitic and tuff pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) gravelly sandy loam, dark brown (10YR 3/3) moist; weak very thin and thin platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; many very fine interstitial pores; 10 percent obsidian and 20 percent hard pyroclastic, tuff and rhyolitic pebbles; neutral (pH 6.6); clear wavy boundary.

A2--2 to 10 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, very friable, nonsticky and nonplastic; many very fine, common fine and few medium roots; many very fine tubular pores; 10 percent obsidian and 15 percent hard pyroclastic, tuff and rhyolitic pebbles; neutral (pH 6.8); clear wavy boundary.

Bw--10 to 17 inches; pale brown (10YR 6/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many very fine, common fine and few medium roots; many very fine tubular pores; 20 percent hard glassy vitric pyroclastic pebbles; 5 percent rhyolitic and tuff pebbles; few thin glass coats bridging mineral grains; neutral (pH 7.0); clear wavy boundary.

BC--17 to 28 inches; very pale brown (10YR 7/3) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many very fine tubular pores; 40 percent hard glassy vitric pyroclastic pebbles; 5 percent rhyolitic and tuff pebbles; few thin glass coats bridging mineral grains; neutral (pH 7.0); clear wavy boundary.

C--28 to 36 inches; very pale brown (10YR 7/3) extremely gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial pores; 50 percent hard glassy vitric pyroclastic pebbles; 15 percent rhyolitic and tuff

pebbles; 10 percent cobbles; neutral (pH 7.0); clear irregular boundary.

Cr--36 to 46 inches; highly fractured weathered glassy vitric pyroclastic rock with admixtures of rhyolitic and tuff rocks; many moderately thick glass coats; few very fine roots in some fractures.

Type location: Washoe County, Nevada. On the south flank of Nut Mountain in an unsectioned area. T. 42 N., R. 22 E.; (41 degrees, 34 minutes, 05 seconds north latitude and 119 degrees, 27 minutes, 05 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from July through October.

Soil temperature: 44 to 47 degrees F.

Depth to weathered bedrock: 20 to 40 inches.

Mollic epipedon: 10 to 20 inches.

Mineralogy: 60 to 80 percent glass in the very fine and fine sand size throughout.

Reaction: Slightly acid or neutral.

Control section:

Clay content--10 to 18 percent.

Rock fragments--40 to 60 percent pebbles that are dominantly hard vitric pyroclastic rocks when mixed.

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Dry value of 6 is only in the surface 2 inches.

Chroma--2 or 3.

Bw horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 3 or 4 moist.

Chroma--3 or 4.

BC horizon:

Value--6 or 7 dry, 3 or 4 moist.

Chroma--3 or 4.

C horizon:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Texture--Extremely gravelly or very gravelly sandy loam or coarse sandy loam.

Old Camp Series

The Old Camp series consists of shallow, well drained soils that formed in residuum and colluvium weathered from tuffs, basalt, rhyolite and andesite with a minor

component of volcanic ash. Old Camp soils are on hills, mountains, and plateaus. Slopes are 4 to 30 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Lithic Xeric Haplargids

Typical pedon: Old Camp very stony loam, in map unit 1063. Rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 5 percent stones, 10 percent cobbles, and 20 percent pebbles.

A--0 to 2 inches; light brownish gray (10YR 6/2) very stony loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine vesicular pores; 5 percent stones, 10 percent cobbles and 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt1--2 to 7 inches; pale brown (10YR 6/3) very cobbly clay loam, dark brown (10YR 3/3) moist; moderate very fine and fine subangular blocky structure; soft, very friable; sticky and plastic; many very fine and fine, and few medium roots; many very fine interstitial pores; common thin and moderately thick clay films on faces of peds and in pores; 30 percent pebbles and 20 percent cobbles; neutral (pH 6.8); abrupt wavy boundary.

Bt2--7 to 15 inches; brown (10YR 5/3) very cobbly clay loam, dark brown (10YR 3/3) moist; moderate medium and fine subangular blocky structure; hard, friable, sticky and plastic; many very fine and fine roots; many very fine interstitial pores; common thin and moderately thick clay films on faces of peds and in pores; 3 percent stones, 30 percent cobbles and 20 percent pebbles; slightly alkaline (pH 7.6); abrupt irregular boundary.

R--15 to 19 inches; dark gray (10YR 4/1) basalt with few thin lime coats on rock surface.

Type location: Washoe County, Nevada; about 2.5 miles south of Road 8A and 3 miles southwest of Painted Point in an unsectioned area. (41 degrees, 32 minutes, 48 seconds north latitude and 119 degrees, 43 minutes, 11 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 52 degrees F.

Depth to bedrock: 10 to 20 inches.

Control section:

Clay content--27 to 35 percent.

Rock fragments--50 to 75 percent, dominantly cobbles and stones. The upper part has 35 to 50 percent rock fragments in some pedons.

A horizon:

Value--5 through 7 dry, 3 or 4 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizons:

Hue--10YR to 7.5YR

Value--4 through 7 dry, 3 through 5 moist.

Chroma--2 through 4.

Texture--Clay loam or sandy clay loam, with subhorizons in some pedons of loam, modified by average of 50 to 75 percent rock fragments, mainly cobbles and stones.

Consistence--Soft to hard dry, very friable to friable, slightly sticky to sticky and slightly plastic to plastic.

Structure--Weak to strong, coarse to fine angular or subangular blocky or massive.

Reaction--Neutral or slightly alkaline in the upper part, neutral to strongly alkaline in the lower part.

Effervescence--Slightly effervescent to strongly effervescent.

Other features--Few to continuous lime coats on rock fragment or bedrock.

Oreneva Series

The Oreneva series consists of moderately deep, well drained soils that formed in residuum and colluvium from basalt. Oreneva soils are on plateaus. Slopes are 2 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Xeric Haplocambids.

Typical pedon: Oreneva very gravelly loam, 2 to 15 percent slopes, in map unit 1070, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 40 percent pebbles.

A--0 to 2 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate thick platy structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine interstitial pores; 40 percent pebbles; neutral (pH 6.8); clear smooth boundary.

Bw1--2 to 10 inches; pale brown (10YR 6/3) loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, sticky and slightly plastic; common fine and very fine roots; common very fine interstitial pores; 10 percent pebbles; neutral (pH 7.2); clear smooth boundary.

Bw2--10 to 30 inches; light yellowish brown (10YR 6/4) very gravelly loam, yellowish brown (10YR 5/4) moist; weak coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; common very fine interstitial pores; 40 percent pebbles, 5 percent cobbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

2R--30 to 34 inches; basalt.

Type location: Washoe County, Nevada; near the Nevada-Oregon state line, about 600 feet east and 200 feet south of the northwest corner of section 16, T. 47 N., R. 21 E.; (41 degrees, 59 minutes, 44 seconds north latitude and 119 degrees, 37 minutes, 59 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring; dry from late June through October.

Soil temperature: 44 to 47 degrees F.

Average summer soil temperature: 59 to 61 degrees F.

Depth to bedrock: 20 to 40 inches, but typically is 20 to 30 inches.

Control section:

Clay content--18 to 27 percent when mixed.

Rock fragments--35 to 50 percent, dominantly pebbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Chroma--2 or 3 dry.

Reaction--Neutral or slightly alkaline.

Bw1 horizon:

Value 5 or 6 dry, 3 or 4 moist.

Texture--Loam or clay loam.

Clay content--18 to 30 percent.

Rock fragments--0 to 15 percent pebbles, 0 to 5 percent cobbles.

Reaction--Neutral or slightly alkaline.

Bw2 horizon:

Value--5 through 7 dry, 3 through 5 moist.

Chroma--3 or 4 moist

Texture--Loam or clay loam.

Clay content--18 to 30 percent.

Rock fragments--35 to 50 percent pebbles, 0 to 15 percent cobbles.

Reaction--Slightly alkaline or moderately alkaline.

Other--Some pedons have a C horizon which is similar to the Bw2 horizon, but is massive.

Orr Series

The Orr series consists of very deep, well drained soils that formed in mixed alluvium. These soils are on alluvial fans terraces, fan piedmont remnants, terraces, inset fans and hill slopes. Slopes are 2 to 8 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Aridic Argixerolls

Typical pedon: Orr sandy loam, in map unit 1395, pasture. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; grayish brown (10YR 5/2) sandy loam, very dark brown (10YR 2/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; many very fine roots; 10 percent pebbles; slightly acid (pH 6.5); clear wavy boundary.

A2--3 to 9 inches; dark grayish brown (10YR 4/2) sandy loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; slightly hard, friable,

- slightly sticky and slightly plastic; many very fine and fine roots; common very fine tubular pores; 5 percent pebbles; slightly acid (pH 6.5); clear wavy boundary.
- Bt1--9 to 14 inches; brown (10YR 4/3) gravelly sandy clay loam, very dark grayish brown (10YR 3/2) moist; strong fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and fine roots; many very fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.0); gradual wavy boundary.
- Bt2--14 to 27 inches; brown (10YR 5/3) gravelly sandy clay loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; very hard, firm, sticky and plastic; few fine and medium roots; many very fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.
- Bt3--27 to 44 inches; light yellowish brown (10YR 6/4) gravelly sandy clay loam, dark brown (10YR 4/3) moist; weak medium and coarse subangular blocky structure; hard, firm, sticky and plastic; few fine and medium roots; common very fine tubular pores; common thin clay films on faces of peds and in pores; 20 percent pebbles; neutral (pH 7.2); clear boundary.
- C--44 to 60 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few fine and medium roots; many very fine interstitial pores; 20 percent pebbles; neutral (pH 7.2).

Type location: Washoe County, Nevada; about 1,600 feet east and 800 feet north of the southwest corner of section 20, T. 44 N., R. 19 E.; (41 degrees, 42 seconds, 53 minutes north latitude and 119 degrees, 52 minutes, 50 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in the late winter and spring, dry summer and fall.

Soil temperature: 49 to 53 degrees F.

Mollic epipedon: 10 to 20 inches thick and may include the upper part of the Bt horizon.

Thickness of argillic horizon: 35 to 45 inches.

Control section:

Clay content--18 to 25 percent.

Rock fragments--Less than 35 percent.

A horizons:

Hue of 10YR or 7.5YR.

Value--4 or 5 dry.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR

Value--5 or 6 dry.

Chroma--3 or 4.

Texture--Sandy loam, sandy clay loam or loam

Structure--Angular blocky, subangular blocky or prismatic, or it is massive.

Rock fragment--0 to 35 percent in any one horizon, averages 10 to 25 percent.

C horizon:

Hue--10YR or 7.5YR

Value--6 or 7 dry, 4 through 6 moist

Chroma--3 or 4.

Texture--Sand, loamy fine sand, sandy loam, fine sandy loam, sandy clay loam, clay loam and is gravelly or very gravelly in some pedons.

Rock fragments--Cobbles range from 0 to 5 percent, pebbles range from 10 to 25 percent.

Durinodes--Are in some pedons but average less than 20 percent.

Paypoint Series

The Paypoint series consists of very deep, well drained soils that formed in alluvium from mixed rock sources and influenced by volcanic ash. The Paypoint soils are on lagoons. Slopes are 0 to 2 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy over sandy or sandy-skeletal, mixed, mesic Durinodic Xeric Haplargids

Typical pedon: Paypoint gravelly fine sandy loam, in map unit 1045, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; pale brown (10YR 6/3) gravelly fine sandy loam, dark brown (10YR 3/3) moist; thick and very thick platy structure; hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine and fine vesicular pores; 15 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

A2--2 to 5 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 3/3) moist; strong very thick platy structure; hard, very friable, nonsticky and nonplastic; few very fine roots; many very fine and fine vesicular pores; 15 percent pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

Bt--5 to 11 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; common very fine, few fine roots; common very fine tubular pores; common thin clay films on peds and lining pores; 5 percent pebbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bqk--11 to 17 inches; very pale brown (10YR 7/4) loam, dark yellowish brown (10YR 4/4) moist; moderate medium platy structure; hard, friable and firm, slightly sticky and slightly plastic; few very fine and fine roots; many very fine interstitial and few very fine tubular pores; 80 percent weak discontinuous silica and lime cementation; common moderately thick silica coats bridging mineral grains; common fine horizontal soft masses of lime; violently effervescent; moderately alkaline (pH 8.0); abrupt wavy boundary.

2Ckq1--17 to 25 inches; light yellowish brown (2.5Y 6/4) very gravelly loamy sand, olive brown (2.5Y 4/4) moist; massive; loose, nonsticky, nonplastic; few very fine

roots; many very fine interstitial pores; 40 percent pebbles; 20 percent of underside of rock fragments have less than 1 millimeter thick silica-lime coats; violently effervescent; moderately alkaline (pH 8.2); abrupt smooth boundary.

3Ckq2--25 to 36 inches; light yellowish brown (2.5Y 6/4) very gravelly sand, olive brown (2.5Y 4/4) moist; massive; loose, nonsticky, nonplastic; few very fine roots; very fine interstitial pores; common thin and moderately thick silica coats bridging mineral grains; 50 percent pebbles; violently effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

4C--36 to 60 inches; pale brown (10YR 6/3) gravelly fine sand, dark brown (10YR 4/3) moist; massive; loose, nonsticky, nonplastic; few very fine roots; very fine interstitial pores; 30 percent pebbles; violently effervescent; moderately alkaline (pH 8.4)

Type location: Washoe County, Nevada. About 5 miles east of Vya, Nevada on Road 8A; about 2 miles southwest of Painted Point; 150 feet south of Road 8A at trail to Lone Spring; (41 degrees, 34 minutes, 53 seconds north latitude and 119 degrees, 44 minutes, 01 second west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October.

Soil temperature: 47 to 51 degrees F.

Depth to carbonates: 11 to 24 inches.

Depth to contrasting layers: 16 to 30 inches.

Other features: 35 to 55 percent glass in the very fine and fine sand size in the A, Bt, and Bqk horizons. 5 to 20 percent glass in the C horizons.

Control section:

Clay content--18 to 25 percent

Sand content--35 to 50 percent.

A horizons:

Value--5 or 6 dry, 4 or 5 moist

Chroma--2 or 3

Reaction--Slightly alkaline or moderately alkaline.

Bt horizon:

Value--5 or 6 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Loam or sandy clay loam.

Clay content--18 to 25 percent.

Rock fragments--0 to 10 percent, mainly pebbles.

Reaction--Slightly alkaline or moderately alkaline.

2Ckq1 and 3Ckq2 horizons:

Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Structure--thin through thick platy.

Clay content--0 to 2 percent.

Rock fragments--35 to 50 percent pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Slightly effervescent to violently effervescent; few to many 0.5 millimeter to 1.0

millimeter lime coats on under side of rock fragments.

4C horizon:

Hue--10 YR or 2.5Y.

Value--6 or 7 dry.

Chroma--3 or 4.

Texture--Sand, fine sand or loamy sand in the fine earth fraction.

Clay content--0 to 2 percent.

Rock fragments--30 to 50 percent pebbles.

Reaction--Moderately alkaline or strongly alkaline.

Powlow Series

The Powlow series consists of shallow to duripan, well drained soils that formed in alluvium derived from volcanic rocks. The Powlow soils are on fan piedmont remnants. Slopes are 2 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic, shallow Argidic Durixerolls.

Typical pedon: Powlow very gravelly loam, in map unit 1431, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with approximately 2 percent cobbles, 40 percent pebbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine and fine vesicular pores; 2 percent cobbles, 40 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

A2--2 to 6 inches; grayish brown (10YR 5/2) gravelly loam, dark brown (10YR 3/3) moist; strong very thin and thin platy structure; slightly hard, friable, sticky and plastic; many very fine and common fine roots; many very fine vesicular pores; 30 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.

Bt1--6 to 10 inches; brown (10YR 5/3) gravelly clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine roots; common fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt2--10 to 15 inches; strong brown (7.5YR 5/6) gravelly clay, strong brown (7.5YR 4/6) moist; moderate fine prismatic structure parting to strong fine and medium subangular blocky; very hard, very friable, very sticky and very plastic; common very fine and few fine roots; common fine tubular pores; many thin and moderately thick clay films on faces of peds and lining pores; 20 percent pebbles; slightly alkaline (pH 7.4); abrupt wavy boundary.

Bqm--15 to 25 inches; pink (7.5YR 7/4) strongly silica cemented duripan, yellowish brown (10YR 5/6) moist;

strong thick platy structure; extremely hard, extremely firm; common very fine roots matted on plate surfaces; alternate horizontal light brown (7.5YR 6/4) 1 to 2 millimeter thick silica laminae on tops of plates, dark brown (7.5YR 4/4) moist; slightly alkaline (pH 7.8); clear smooth boundary.

Bqkm1--25 to 36 inches; reddish yellow (7.5YR 7/6) continuous strongly silica and lime cemented duripan, strong brown (7.5YR 5/6) moist; massive; extremely hard, extremely firm; common medium and large horizontal masses of lime; many less than 0.5 millimeter lime and silica coats on underside of pebbles; violently effervescent; moderately alkaline (pH 8.0); clear wavy boundary.

Bqkm2--36 to 60 inches; pink (7.5YR 8/4) strongly and weakly silica and lime cemented duripan, strong brown (7.5YR 5/6) moist; massive; very hard, extremely firm and very firm; common alternate horizontal discontinuous 0.5 to 2 millimeter silica laminae; few fine and medium horizontal lime masses; strongly effervescent; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; near the Sheldon Antelope Refuge in an unsectioned area, T. 43 N., R. 22 E.; (41 degrees, 37 minutes, 59 seconds north latitude and 119 degrees, 28 minutes, 45 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, dry mid-June through October.

Soil temperature: 47 to 51 degrees F.

Depth to duripan: 14 to 20 inches.

Control section:

Clay content--35 to 50 percent.

Thickness of mollic: 9 to 15 inches and includes the upper part of the Bt horizon.

Reaction: Neutral to moderately alkaline.

A horizons:

Value--2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--7.5YR or 10YR.

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 through 6.

Texture--Clay, gravelly clay, clay loam or gravelly clay loam.

Rock fragments--10 to 25 percent, dominantly pebble-sized.

Structure--Subangular blocky, angular blocky or prismatic parting to subangular or angular blocky.

Bqkm horizons:

Hue--7.5YR or 10YR.

Value--6 to 8 dry, 4 or 5 moist.

Chroma--4 through 6.

Raglan Series

The Raglan series consists of very deep, well drained soils that formed in loamy mixed alluvium and lacustrine materials derived from mixed rock sources with a component of loess and volcanic ash. The Raglan soils are on fan skirts, alluvial flat remnants, basin floor remnants and lake plain terraces. Slopes are 0 to 2 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Durinodic Haplocambids

Typical pedon: Raglan very fine sandy loam, in map unit 1230, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 3 inches; pale brown (10YR 6/3) very fine sandy loam, dark grayish brown (10YR 4/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and slightly plastic; few very fine and fine roots; many very fine vesicular pores; strongly effervescent; strongly alkaline (pH 8.6); abrupt smooth boundary.

Bw--3 to 14 inches; pale brown (10YR 6/3) silt loam, dark grayish brown (10YR 4/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine tubular pores; many very fine and fine and few medium roots; strongly effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Bqk--14 to 26 inches; very pale brown (10YR 7/3) silt loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, sticky and plastic; common very fine, and few fine roots; few very fine tubular pores; 40 percent hard 5 to 15 millimeter durinodes; violently effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

2C1--26 to 33 inches; pale brown (10YR 6/3) sandy loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, sticky and plastic; many very fine and fine roots; common very fine tubular pores; strongly effervescent; strongly alkaline (pH 8.8).

3C2--33 to 41 inches; light gray (2.5Y 7/2) silty clay loam, grayish brown (2.5Y 5/2) moist; massive; soft, very friable, sticky and plastic; common very fine and fine roots; many very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.8); abrupt smooth boundary.

4C3--41 to 61 inches; light gray (2.5Y 7/2) very fine sandy loam, grayish brown (2.5Y 5/2) moist; massive; soft, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine interstitial pores; strongly effervescent; strongly alkaline (pH 8.6).

Type location: Washoe County, Nevada; about 2,100 feet west and 1,100 feet south of the northeast corner of section 8 T. 41 N., R. 18 E.; (41 degrees, 29 minutes,

34 seconds north latitude and 119 degrees, 59 minutes, 36 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in the winter and spring, dry from summer to mid fall.

Soil temperature: 47 to 52 degrees F.

Depth to Bqk horizon: 10 to 20 inches.

Reaction: Mildly alkaline to very strongly alkaline, usually increasing with depth.

Salt and sodium: The soils are normally non-saline to slightly saline-sodic affected to a depth of 10 to 20 inches and slight to strongly affected below. Moderate or strongly saline-sodic affected phases are recognized.

Textures: Stratified, including loam, silt loam, very fine sandy loam, clay loam and silty clay loam; averages silt loam with more than 15 percent sand coarser than very fine sand.

Other features: Mineralogy is mixed, but has a strong influence from volcanic ash.

Control section:

Clay content--18 to 25 percent.

Profile color: Hue--10YR or 2.5Y.

Value--6 or 7 dry, 4 or 5 moist.

Chroma--2 through 4.

A horizon:

Effervescence--Noneffervescent to strongly effervescent.

Bw horizon:

Structure--Fine to thick platy, prismatic or subangular blocky or is massive.

Effervescence--Noneffervescent to strongly effervescent.

SAR--13 to 30.

Bqk horizon:

Durinodes--20 to 80 percent, up to 40 percent discontinuous weak silica cementation is common in any subhorizon where durinodes are present.

Durinodes are hard or very hard dry, firm or very firm, moist and are brittle.

Consistence--Matrix is soft to hard, dry, and very friable or friable moist.

SAR--13 to 45.

2C and 3C horizons:

Hue--2.5Y or 5Y.

Structure--Platy or horizon is massive.

Effervescence--Slightly effervescent to violently effervescent.

Other features--Lacustrine material with hue of 2.5Y or 5Y and relict mottles with reddish-hue (7.5YR or 5YR) and high chroma (4 through 6) iron stains commonly occur below depths of 24 inches. Gypsum segregations and shells from various aquatic animals are in the lacustrine material in most pedons.

SAR--13 to 45.

Reywat Series

The Reywat series consists of shallow, well or somewhat excessively drained soils that formed in material weathered from basalt or similar rocks. Reywat soils are on uplands and mountains and have slopes of 4 to 75 percent. The mean annual precipitation is about 12 inches and the mean annual air temperature is about 48 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Lithic Argixerolls

Typical pedon: Reywat very stony loam, in map unit 1326, rangeland. (Colors are for dry soil unless otherwise noted). The soil surface is partially covered with 10 percent stones, 10 percent cobbles, and 20 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) very stony loam, very dark grayish brown (10YR 3/2) moist; moderate very thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine tubular pores; 10 percent stones, 10 percent cobbles, 20 percent pebbles; neutral (pH 6.6); abrupt wavy boundary.

A2--2 to 6 inches; brown (10YR 5/3) very stony loam, very dark grayish brown (10YR 3/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine tubular pores; 30 percent pebbles, 10 percent cobbles and 15 percent stones; neutral (pH 6.6); clear wavy boundary.

Bt1--6 to 11 inches; brown (10YR 5/3) very gravelly loam dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine roots; common very fine tubular pores; common thin clay films on faces of peds and in pores; 50 percent pebbles and 5 percent cobbles; neutral (pH 6.6); clear wavy boundary.

Bt2--11 to 18 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, friable, sticky and plastic; common very fine roots; common very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; 40 percent pebbles and 10 percent cobbles; neutral (pH 6.6); abrupt irregular boundary.

R--18 to 22 inches; basalt. Slightly decomposed. Slightly effervescent at upper surface and in some cracks.

Type location: Washoe County, Nevada; about 100 feet east and 200 feet north of the southwest corner of section 29, T. 47 N. R. 19 E.; (41 degrees, 57 minutes, 35 seconds north latitude and 119 degrees, 53 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 54 degrees F.

Average summer soil temperature: 65 to 71 degrees F.

Depth to bedrock: 10 to 20 inches.

Base saturation: Greater than 75 percent throughout the entire pedon.

A horizons:

Hue--10YR or 7.5YR
Value--4 or 5 dry, 2 or 3 moist
Chroma--2 or 3 dry and moist
Reaction--Slightly acid to moderately alkaline

Bt horizons:

Hue--10YR or 7.5YR
Value--5 or 6 dry, 2 through 4 moist
Chroma--2 or 3 dry and moist
Textures--Very gravelly or very cobbly clay loam, sandy clay loam or loam
Percent clay--24 to 35 percent
Rock fragments--35 to 70 percent
Reaction--Neutral to moderately alkaline
Effervescence--Slightly effervescent or strongly effervescent just above bedrock or in cracks in the bedrock

Saraph Series

The Saraph series consists of shallow, well drained soils that formed in residuum from soft tuffs with a minor admixture of basalt, loess and colluvium from basalt. The Saraph soils are on pediments and plateaus. Slopes are 4 to 30 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Ashy, mesic, shallow Vitrixerandic Haplargids

Typical pedon: Saraph very gravelly sandy loam, in map unit 1245, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 50 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak thin platy structure; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine and fine vesicular pores; 50 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

A2--2 to 4 inches; light brownish gray (10YR 6/2) gravelly sandy loam, dark grayish brown (10YR 4/2) moist; moderate very thin and thin platy structure; slightly hard, very friable, nonsticky and nonplastic; few very fine and fine roots; many very fine tubular pores; 30 percent pebbles; neutral (pH 7.0); abrupt smooth boundary.

Bt1--4 to 9 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; few thin clay films on faces of peds and in pores; 10 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt2--9 to 16 inches; pale brown (10YR 6/3) sandy clay loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, friable,

sticky and plastic; common very fine and fine roots; many very fine tubular pores; many thin clay films on faces of peds and in pores; 10 percent pebbles; neutral (pH 7.0); abrupt wavy boundary.
Cr--16 to 30 inches; soft weathered pyroclastic tuff; few thin lime coats on some fractures.

Type location: Washoe County, Nevada; about 1.4 miles southwest of Coyote Camp; about 0.2 miles south of Road 8A in an unsectioned area. (41 degrees, 35 minutes, 48 seconds north latitude and 119 degrees, 32 minutes, 18 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring; dry from late June through October.

Soil temperature: 47 to 52 degrees F.

Reaction: Neutral or slightly alkaline.

Depth to paralithic contact: 14 to 20 inches.

Mineralogy: 50 to 70 percent glass in the very fine and fine sand size throughout.

Control section:

Clay content--18 to 30 percent.

Rock fragments--0 to 15 percent.

A horizons:

Value--3 or 4 moist.

Chroma--2 or 3.

Bt1 horizons:

Value--5 or 6 dry, 3 or 4 moist.

Texture--Sandy loam or sandy clay loam.

Clay content--15 to 25 percent.

Rock fragments--0 to 15 percent.

Bt2 horizons:

Value--5 or 6 dry, 3 or 4 moist.

Texture--Sandy clay loam or clay loam.

Clay content--20 to 35 percent.

Rock fragments--0 to 15 percent.

Structure--Moderate or strong, fine or medium, angular blocky or subangular blocky.

Other features--May be slightly calcareous and have few or common lime segregations.

Schamp Series

The Schamp series consists of very deep, well drained soils that formed in mixed alluvium and colluvium from tuff, andesite and basalt with admixtures of volcanic ash. The Schamp soils are on foothills, mountain side slopes and ridges. Slopes are 4 to 50 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Xeric Haplargids

Typical pedon: Schamp very stony loam, in map unit 1220, rangeland. (Colors for dry conditions unless

otherwise noted). The soil surface is covered with 10 percent stones, 5 percent cobbles, and 15 percent pebbles.

- A--0 to 5 inches; light brownish gray (10YR 6/2) very stony loam, very dark grayish-brown (10YR 3/2) moist; moderate very thin and thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 10 percent stones, 5 percent cobbles and 15 percent pebbles; neutral (pH 7.0); clear smooth boundary.
- Bt1--5 to 8 inches; light brownish gray (10YR 6/2) clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine and few fine and medium roots; many very fine tubular pores; few thin clay films on faces of peds and in pores; neutral (pH 7.2); abrupt wavy boundary.
- Bt2--8 to 15 inches; brown (10YR 5/3) clay, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, friable, very sticky and very plastic; many very fine and fine and few medium roots; many very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; neutral (pH 7.2); clear wavy boundary.
- Bt3--15 to 20 inches; brown (10YR 5/3) clay, dark brown (10YR 3/3) moist; weak fine prismatic structure parting to moderate medium subangular blocky; hard, friable, very sticky, very plastic; common very fine and fine and few medium roots; many very fine tubular pores; common thin and moderately thick clay films on faces of peds and in pores; slightly alkaline (pH 7.7); clear wavy boundary.
- Btk--20 to 32 inches; pale brown (10YR 6/3) clay loam, brown (10YR 4/3) moist; moderate coarse subangular blocky structure; hard, very friable, very sticky and very plastic; common very fine and few fine roots; common very fine tubular pores; common thin clay films on faces of peds and in pores; 10 percent pebbles; few thin lime coats on underside of pebbles; noneffervescent matrix; moderately alkaline (pH 8.2); clear wavy boundary.
- Ck--32 to 43 inches; pale brown (10YR 6/3) sandy clay loam, brown (10YR 4/3) moist; massive; hard, very friable, sticky, plastic; common very fine and fine roots; common very fine tubular pores; 5 percent pebbles and 5 percent cobbles; few thin lime coats on underside of rock fragments; few small soft masses of lime; noneffervescent matrix; strongly alkaline (pH 8.5); clear wavy boundary.
- 2C2--43 to 60 inches; pale brown (10YR 6/3) very cobbly loam, brown (10YR 4/3) moist; massive; slightly hard, friable, slightly sticky, slightly plastic; few fine roots; common very fine tubular pores; 25 percent cobbles and 20 percent pebbles; slightly effervescent; strongly alkaline (pH 8.9).

Type location: Washoe County, Nevada; about 1.8 miles east of the Nevada-California state line on the east side of Surprise Valley; about 1,100 feet east and 400 feet south of the northwest corner of section 15, T. 42 N., R. 18 E.; (41 degrees, 34 minutes, 00 seconds north latitude and 119 degrees, 57 minutes, 45 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 50 degrees F.

Control section:

Clay content--35 to 50 percent.

A horizon:

Value--5 or 6 dry, 3 or 4 moist

Chroma--2 or 3

Reaction--Neutral or slightly alkaline

Bt horizons:

Hue--10YR or 7.5YR

Value--5 or 6 dry, 3 or 4 moist

Chroma--2 through 4

Structure--Weak or moderate, fine to coarse prismatic, subangular blocky or angular blocky

Reaction--Neutral to moderately alkaline

Texture--Clay or clay loam

Clay content--35 to 50 percent

Rock fragments--0 to 15 percent

Thickness--24 to 32 inches

Btk horizons:

Secondary lime accumulations--Few to many fine to coarse soft masses

Effervescence--Noneffervescent or slightly effervescent matrix

C and 2C:

Value--5 through 7 dry, 4 or 5 moist

Chroma--2 or 3

Texture--Sandy loam, sandy clay loam, gravelly sandy clay loam or very cobbly loam

Clay content--10 to 25 percent

Rock fragments--15 to 80 percent increasing with depth, mainly pebbles and cobbles

Reaction--Strongly alkaline or very alkaline

Effervescence--Noneffervescent to strongly effervescent in the upper part. Slightly effervescent to violently effervescent in the lower part

Secondary lime accumulations--None to many fine to coarse soft masses

SAR--13 to 30 in the Bt2 and Bt3 horizons

Electrical conductivity--4 to 8 millimhos per centimeter

Skullwak Series

The Skullwak series consists of deep, poorly drained soils that formed in fine textured lacustrine sediments from mixed rock sources. These soils are on lake plains. Slopes are 0 to 2 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine, montmorillonitic (calcareous), mesic Aeric Halaquepts

Typical pedon: Skullwak silt loam, in map unit 1050, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 5 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate very thick platy structure; soft, friable, sticky and plastic; few very fine roots; many very fine vesicular pores; violently effervescent; very strongly alkaline (pH 9.4); clear smooth boundary.

C--5 to 11 inches; light gray (2.5Y 7/2) silty clay loam, olive brown (2.5Y 4/3) moist; moderate thin and medium platy structure; hard, friable, very sticky and very plastic; common very fine and fine roots; common very fine interstitial pores; violently effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

2Bqk--11 to 18 inches; light gray (5Y 7/2) silty clay loam, olive (5Y 4/3) moist; strong thin and medium platy structure; hard, friable, very sticky and very plastic; common very fine and fine roots; common very fine interstitial pores; 30 percent 15 to 25 millimeter durinodes; lime is disseminated; violently effervescent; strongly alkaline (pH 9.0); abrupt smooth boundary.

3Bqkg--18 to 36 inches; light gray (5Y 7/2) silty clay, olive (5Y 4/3) moist; strong medium and thick platy structure; hard, friable, very sticky and very plastic; common very fine and fine roots; few very fine tubular pores; 60 percent 15 to 25 millimeter durinodes; 20 percent grayish green (5G 5/2) moist iron depletions; lime is disseminated; slightly effervescent; strongly alkaline (pH 8.8); clear smooth boundary.

4Cg1--36 to 40 inches; light gray (5Y 7/2) silty clay, olive (5Y 5/3) moist; massive; hard, very friable, sticky and very plastic; few very fine roots; few very fine tubular pores; 10 percent grayish green (5G 5/2) moist iron depletions; slightly effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

4Cg2--40 to 60 inches; light gray (5Y 7/2) stratified silty clay loam and silty clay, olive (5Y 4/3) moist; massive; hard, friable, very sticky and very plastic; no roots observed; few very fine interstitial pores; 10 percent grayish green (5G 5/2) moist iron depletions; slightly effervescent; moderately alkaline (pH 8.2)

Type location: Washoe County, Nevada; about 1.6 miles northeast of Vya; about 950 feet north and 100 feet west of the southeast corner of section 28, T. 43 N., R. 19 E.; (41 degrees, 36 minutes, 54 seconds north latitude and 119 degrees, 50 minutes, 57 seconds west longitude.)

Range in Characteristics:

Soil moisture: The soil is saturated year round between a depth of 18 to 36 inches.

Soil temperature: 47 to 52 degrees F.

Depth to Bqk horizon: 8 to 14 inches.

SAR: 31 to 45 above Bqk horizon, 13 to 30 below.

Control section:

Clay content--35 to 45 percent, when mixed.

Reaction--Moderately alkaline to very strongly alkaline usually decreasing with depth.

Salt--Strongly affected above the Bqk horizon and

moderately affected within and below the Bqk horizon.

A horizon:

Value--7 or 8 dry, 4 through 6 moist.
Chroma--2 or 3.

C and Bqk horizons:

Hue--10YR in the upper part and 5Y or 2.5Y in the lower part.

Chroma--2 through 4 in the upper part and 1 or 2 in the lower part.

Texture--Stratified silty clay loam or silty clay.

Soughe Series

The Soughe series consists of shallow, well drained soils that formed in residuum and colluvium from various rocks. Soughe soils are on rock core areas of fan piedmont remnant side slopes, hills, plateaus, mountain ridges, crests, summits, shoulders and side slopes. Slopes are 4 to 50 percent. Mean annual precipitation is about 9 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Loamy-skeletal, mixed, mesic Lithic Xeric Haplargids

Typical pedon: Soughe very cobbly loam, in map unit 1131, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 30 percent cobbles 20 percent pebbles.

A--0 to 4 inches; pale brown (10YR 6/3) very cobbly loam, dark brown (10YR 3/3) moist; moderate fine and medium platy structure; slightly hard, very friable, sticky and plastic; many very fine roots; common very fine vesicular; 30 percent cobbles, 20 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt1--4 to 8 inches; pale brown (10YR 6/3) very gravelly clay loam, dark brown (10YR 3/3) moist; fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and few fine and medium roots; common very fine tubular pores; common thin clay films on faces of peds and lining pores; 30 percent pebbles, 10 percent cobbles; slightly alkaline (pH 7.8); clear wavy boundary.

Bt2--8 to 17 inches; yellowish brown (10YR 5/4) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, sticky and plastic; few very fine, fine, and medium roots; common very fine tubular pores; common moderately thick clay films on faces of peds and lining pores; 30 percent pebbles, 10 percent cobbles; slightly alkaline (pH 7.8); abrupt wavy boundary.

R--17 to 21 inches; hard massive tuff.

Type location: Washoe County, Nevada; about 2,000 feet east and 900 feet north of the southwest corner of section 10, T. 41 N., R. 18 E.; (41 degrees, 29 minutes, 01 second north latitude, 119 degrees, 57 minutes, 33 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 50 degrees.

Depth to bedrock: 10 to 20 inches.

Reaction: Neutral to moderately alkaline.

Control section:

Clay content--25 to 35 percent.

Rock fragments--35 to 60 percent, mainly pebbles with 0 to 10 percent cobbles.

A horizon:

Value--5 or 6 dry, 3 or 4 moist.

Bt horizons:

Value--4 through 6 dry, 3 or 4 moist.

Chroma--3 or 4.

Texture--Very gravelly clay loam, very gravelly sandy clay loam, or very gravelly loam.

Structure--Weak to strong, very fine to very coarse subangular blocky or moderate to strong, medium angular blocky.

Consistence--Soft to hard, dry; very friable or friable, moist, sticky or very sticky and plastic or very plastic wet.

Surprise Series

The Surprise series consists of deep, well drained soils that formed in alluvium mainly from basic volcanic rocks. The Surprise soils are on alluvial fans and have slopes of 2 to 15 percent. The mean annual precipitation is about 13 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Coarse-loamy, mixed, mesic Aridic Haploxerolls

Typical pedon: Surprise gravelly loamy sand, in map unit 1075, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; grayish brown (10YR 5/2) gravelly loamy sand, very dark grayish brown (10YR 3/2) moist; weak very thin platy structure; soft, very friable, nonsticky and nonplastic; many fine roots; many very fine interstitial pores; 20 percent pebbles; neutral (pH 6.8); clear smooth boundary.

A2--2 to 9 inches; brown (10YR 4/3) sandy loam, very dark grayish brown (10YB 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine roots; many very fine interstitial pores; neutral (pH 6.8); clear wavy boundary.

Bw1--9 to 17 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate medium and coarse subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many fine roots; many fine tubular pores; 30 percent pebbles; neutral (pH 6.8); clear wavy boundary.

Bw2--17 to 36 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark brown (10YR 4/3) moist;

weak medium and coarse subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; many fine roots; many fine tubular pores; 30 percent pebbles; neutral (pH 6.8); clear smooth boundary.

C1--36 to 54 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark grayish brown (10YR 4/2) moist; massive; hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine interstitial pores; 30 percent pebbles; neutral (pH 6.8); clear wavy boundary.

C2--54 to 65 inches; very pale brown (10YR 7/3) stratified gravelly sandy loam and gravelly loamy sand, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 40 percent pebbles; neutral (pH 6.8).

Type location: Washoe County, Nevada; about 0.3 miles northwest of Vya in an unsectioned area. (41 degrees, 35 minutes, 35 seconds north latitude and 119 degrees, 51 minutes, 52 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 48 to 54 degrees F.

Thickness of mollic: 8 to 20 inches.

Control section:

Clay content--10 to 18 percent

Rock fragments--15 to 35 percent pebbles

A horizons:

Value--4 or 5 dry

Chroma--2 or 3

Bw and C horizons:

Value--5 through 7 dry, 3 through 5 moist

Tinpan Series

Tinpan series are moderately deep, well drained soils that formed in colluvium and alluvium from basalt, andesite and tuff. The Tinpan soils are on plateaus. Slopes are 0 to 8 percent. The mean annual precipitation is about 14 inches and the mean annual air temperature is about 43 degrees F.

Taxonomic class: Very-fine, montmorillonitic, frigid Vertic Palexerolls

Typical pedon: Tinpan extremely cobbly loam, in map unit 1181, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is covered with 40 percent cobbles and 20 percent pebbles.

A1--0 to 2 inches; light brownish gray (10YR 6/2) extremely cobbly loam, dark brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, friable, sticky and plastic; many very fine roots; many very fine, common fine vesicular pores; 40 percent

cobbles; 20 percent pebbles; neutral (pH 6.8); clear wavy boundary.

A2--2 to 5 inches; brown (10YR 5/3) silty clay loam, very dark grayish brown (10YR 3/2) moist; moderate very fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, common fine roots; many very fine interstitial pores; 10 percent pebbles; neutral (pH 6.8); abrupt wavy boundary.

Btss1--5 to 12 inches; brown (10YR 5/3) clay, dark brown (10YR 3/3) moist; strong medium prismatic structure; extremely hard, extremely firm, very sticky and very plastic; common very fine, fine and medium vertical exped roots; common fine tubular pores; many moderately thick pressure faces on faces of peds; common thin light gray (10YR 7/2) uncoated sand grains, dark grayish brown (10YR 4/2) moist on tops of prisms; vertical cracks 5 millimeters to 15 millimeters wide and 2 to 4 inches apart extend from a depth of 5 to 18 inches; few slickensides; neutral (pH 7.0); clear wavy boundary.

Btss2--12 to 18 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate medium and coarse prismatic structure parting to strong medium and coarse angular blocky; extremely hard, extremely firm, very sticky and very plastic; common very fine, fine and medium vertical exped roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; common slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; neutral (pH 7.2); clear smooth boundary.

Btss3--18 to 28 inches; light brown (7.5YR 6/4) clay, brown (7.5YR 4/4) moist; moderate medium and coarse prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; few very fine, fine and medium vertical exped roots; common very fine tubular pores; many moderately thick clay films on faces of peds and in pores; many slickensides; many wedge-shaped aggregates up to 10 centimeters in size tilted 30 degrees from horizontal; slightly alkaline (pH 7.5); clear smooth boundary.

Btkss--28 to 36 inches; light yellowish brown (10YR 6/4) clay, brown (7.5YR 4/4) moist; strong medium and coarse angular blocky structure; very hard, friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; few slickensides; few wedge-shaped aggregates tilted 30 degrees from horizontal; 3 percent medium and large white (10YR 8/1) soft masses of lime; slightly effervescent matrix; moderately alkaline (pH 8.2); abrupt wavy boundary.

R--36 to 46 inches; hard vesicular basalt; few thin lime coats at upper boundary and in some fractures.

Type location: Washoe County, Nevada; 2.6 miles northeast of Barrel Springs road; about 1,500 feet west and 2,200 feet north of the southeast corner of section 9, T. 46 N., R. 19 E.; (41 degrees, 55 minutes, 18 seconds north latitude and 119 degrees, 51 minutes, 11 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 44 to 47 degrees F.

Average summer soil temperature: 60 to 64 degrees F.

Thickness of mollic: 10 to 16 inches

Depth to bedrock: 20 to 40 inches

Depth to carbonates: 25 to 35 inches

Control section:

Clay content--60 to 70 percent

A horizons:

Value--5 or 6 dry, 2 or 3 moist. Value of 6 only in upper 2 inches. Uncoated sand grains with value of 6 or 7 dry.

Chroma--2 or 3

Btss horizons:

Hue--10YR or 7.5YR

Value--4 through 6 dry, 3 through 5 moist

Chroma--2 through 4

Reaction: Neutral or slightly alkaline

Other features: Vertical cracks 5 to 25 millimeters wide; few to many slickensides and wedge-shaped aggregates

Btkss horizons:

Hue--10YR or 7.5YR

Value--6 or 7 dry, 4 or 5 moist

Secondary lime accumulation: Few to many small to large soft masses or few or common lime coats on bedrock; slightly effervescent to strongly effervescent in matrix

Reaction: Slightly alkaline or moderately alkaline

Toney Series

The Toney soils are moderately deep over weathered bedrock, moderately well-drained soils that formed in material weathered from tuff. They are on tuffaceous tablelands. Slopes are 2 to 8 percent. The mean annual precipitation is about 13 inches and the mean annual air temperature is about 42 degrees F.

Taxonomic class: Fine, montmorillonitic, frigid Vertic Paleargids

Typical pedon: Toney extremely cobbly loam, in map unit 1240, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface has about 60 percent cover of cobbles.

A1--0 to 2 inches; grayish brown (10YR 5/2) extremely cobbly loam, very dark grayish brown (10YR 3/2) when moist; weak thin platy structure; soft, very friable, slightly sticky and slightly plastic; few fine, and many very fine roots; many very fine interstitial and tubular pores; 60 percent cobbles; neutral (pH 6.6); abrupt smooth boundary.

A2--2 to 4 inches; light brownish gray (10YR 6/2) silt loam, very dark grayish brown (10YR 3/2) when moist; light

gray (10YR 6/1) spots, moderate thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few fine and many very fine roots; many very fine interstitial and tubular pores; many bleached sand grains; neutral (pH 6.6); abrupt smooth boundary.

Bt1--4 to 12 inches; brown (10YR 4/3) clay, brown (10YR 4/3) when moist; strong medium columnar structure, with a light-gray (10YR 7/1) bleached sand grain capping; extremely hard, firm, very sticky and very plastic; few fine and common very fine exped roots; common very fine tubular pores; many pressure cutans, and many thin clay films in pores; neutral (pH 6.6); gradual smooth boundary.

Bt2--12 to 18 inches; brown (10YR 5/3) clay, brown (10YR 5/3) moist; moderate medium prismatic structure; very hard, firm, very sticky and very plastic; few fine and common very fine roots; many very fine interstitial, and common very fine tubular pores; many pressure cutans and many thin clay films in pores; neutral (pH 7.2); abrupt smooth boundary.

Btk--18 to 23 inches; brown (10YR 5/3) yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; hard, firm, very sticky and very plastic; few very fine roots; many very fine interstitial and tubular pores; common moderately thick clay films in pores; few thin and moderately thick clay films on faces of peds; strongly effervescent; many fine white (10YR 8/2) lime veins and filaments; moderately alkaline (pH 8.2); abrupt irregular boundary.

Cr--23 to 30 inches; very pale brown (10YR 8/3) tuff, with many white (10YR 8/1) pumiceous flecks, brown (10YR 5/3) when moist; massive; very hard, very firm; few very fine roots along fracture planes; many thin brown (10YR 5/3) clay films along fractures; many faint black (10YR 2/1) coatings on fracture faces; matrix is noneffervescent with few fine lime veins and filaments along fracture planes; slightly alkaline (pH 7.8).

Type location: Washoe County, Nevada; about 1,200 feet west and 1,500 feet north of the southeast corner of section 22, T. 43 N., R. 18 E.; (41 degrees, 37 minutes, 46 seconds north latitude and 119 degrees, 56 minutes, 54 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 43 to 46 degrees F.

Depth to paralithic: 20 to 40 inches

Control section:

Upper 20 inches clay content--40 to 60 percent

A horizons:

Value--4 through 7 dry, 2 through 4 moist

Chroma--1 or 2

Bt horizons:

Hue--10YR or 7.5YR

Value--4 through 6 dry, 4 or 5 moist

Chroma--2 through 4

Texture--Clay or silty clay

Structure--Columnar or prismatic in the upper part, prismatic, angular blocky or subangular blocky in the lower part

Other features--Lime accumulation are common or many fine or medium soft masses in the Btk horizons

Tuffo Series

The Tuffo series consists of very shallow and shallow, somewhat excessively drained soils that formed in residuum from tuff, welded tuff, and tuffaceous sandstone. Tuffo soils are on rock core areas of fan piedmont remnants and hills. Slopes are 15 to 50 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, nonacid, mesic, shallow Vitrandic Torriorthents

Typical pedon: Tuffo very gravelly sandy loam, in map unit 1410, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 20 percent tuff pebbles, 10 percent pumice pebbles, and 5 percent rhyolitic pebbles.

A--0 to 1 inch; gray (10YR 6/1) very gravelly sandy loam, dark grayish brown (10YR 4/2) moist; weak thin platy structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine interstitial pores; 35 percent tuff, pumice and rhyolitic pebbles; slightly alkaline (pH 7.6); abrupt smooth boundary.

C--1 to 8 inches; gray (10YR 6/1) gravelly sandy loam, dark grayish brown (10YR 4/2) moist; weak coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine and few medium roots; many very fine interstitial pores; 25 percent glassy vitric pyroclastic pebbles and cinders; slightly alkaline (pH 7.6); clear wavy boundary.

Cr1--8 to 30 inches; highly weathered and fractured tuffaceous sandstone; massive; few fine roots in fractures; noneffervescent matrix; common less than 0.5 millimeter lime pendants on underside of fractured pieces.

Type location: Washoe County, Nevada, about 1 mile southeast of the Stevens Camp; about 1,700 feet east and 700 feet south of the northwest corner of section 11, T. 41 N., R. 22 E.; (41 degrees, 29 minutes, 13 seconds north latitude, 119 degrees, 28 minutes, 21 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry from late June through October. Torric moisture regime that borders on xeric.

Soil temperature: 47 to 52 degrees F.

Depth to paralithic contact: 4 to 14 inches.

Pyroclastic material: 60 to 75 percent of the 0.02 to 2 mm fraction and 30 to 60 percent of the fine earth fraction.

Control section:

Clay content--5 to 15 percent.
 Rock fragments--5 to 25 percent, mainly pebbles.
 Reaction--Neutral or slightly alkaline.

A horizon:

Value--5 through 7 dry, 3 or 4 moist.
 Chroma--1 through 4 dry or moist.

C horizon:

Hue--2.5Y or 10YR.
 Value--6 or 7 dry, 4 or 5 moist.
 Chroma--2 through 4 dry or moist.
 Texture--Dominantly very fine sandy loam or fine sandy loam with gravelly sandy loam common in some pedons.
 Structure--Massive or is subangular blocky.

Cr horizon:

Secondary lime accumulation--Few or common less than 0.5 millimeter lime pendants along fracture planes.
 Weathering--Highly weathered material in the upper part, to soft weathered material in the lower part.

Tunnison Series

The Tunnison series consists of moderately deep, well drained soils that formed in colluvium over residuum weathered from andesite or basalt. Tunnison soils are on plateaus. Slopes are 0 to 8 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Very-fine, montmorillonitic, mesic
 Aridic Haploxererts

Typical pedon: Tunnison cobbly clay, in map unit 1175, rangeland. (Colors are for dry soil unless otherwise stated.) The soil surface is covered with 15 percent cobbles and 10 percent pebbles.

A1--0 to 2 inches; dark brown (7.5YR 4/3) cobbly clay, dark brown (7.5YR 4/4) moist; strong very fine granular structure; hard, very friable, very sticky and plastic; common very fine roots; many very fine interstitial pores; 15 percent cobbles, 15 percent pebbles; slightly alkaline (pH 7.5); clear wavy boundary.

A2--2 to 5 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate medium and coarse prismatic structure; very hard, firm, very sticky and very plastic; common very fine, few fine and medium roots; many very fine interstitial pores; vertical cracks 10 to 30 millimeters wide and about 3 to 6 inches apart; slightly alkaline (pH 7.5); clear wavy boundary.

A3--5 to 13 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate medium and coarse prismatic structure parting to strong medium and coarse angular blocky; very hard, firm, very sticky and very plastic; few very fine and fine roots; common very fine tubular pores; vertical cracks 10 to 20 millimeters wide and about 3 to 6 inches apart; pressure faces on

75 percent of faces of peds; slightly alkaline (pH 7.5); clear wavy boundary.

Ass--13 to 27 inches; brown (7.5YR 5/4) clay, dark brown (7.5YR 4/4) moist; moderate coarse prismatic structure parting to moderate medium angular blocky; very hard, firm, very sticky and very plastic; few very fine, few fine and common medium roots; common very fine tubular pores; vertical cracks 10 to 20 millimeters wide and about 3 to 6 inches apart; common 10 to 25 millimeter wide wedge-shaped aggregates tilted about 30 degrees from horizontal; common intersecting slickensides; slightly alkaline (pH 7.5); clear wavy boundary.

Cr--27 to 30 inches; reddish yellow (7.5YR 7/6) soft tuff, strong brown (7.5YR 5/8) moist; weathered into medium and coarse plates in upper 2 to 3 inches with discontinuous silica coatings on underside of some plates; clear wavy boundary.

R--30 to 34 inches; hard, consolidated tuff.

Type location: Washoe County, Nevada; about 1,100 feet south of Barrel Springs road along power line; about 3,100 feet south and 3,600 feet west of the northeast corner of section 13, T. 46 N., R. 18 E.; (41 degrees, 54 minutes, 27 seconds north latitude and 119 degrees, 55 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 4 to 50 degrees F.

Depth to weathered bedrock: 20 to 35 inches.

Depth to bedrock: 30 to 40 inches.

Other features: Vertical cracks--are open more than 180 days

Control section:

Clay content--60 to 70 percent

A horizons:

Hue--7.5YR or 5 YR

Value--4 or 5 dry, 3 through 5 moist

Chroma--2 through 4

Other features--Few to many wedge-shaped aggregates and slickensides at a depth of 10 inches to bedrock. Secondary carbonates are at depths of 23 to 30 inches in some pedons.

Tusune Series

The Tusune series consists of moderately deep, well drained soils that formed in residuum and colluvium from andesitic tuff and pyroclastic rocks. The Tusune soils are on north facing plateau side slopes. Slopes are 30 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 44 degrees F.

Taxonomic class: Ashy-skeletal, Vitrandic Cryoborolls.

Typical pedon: Tusune stony loam, in map unit 1440, rangeland (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 1

percent stones, 2 percent cobbles, and 25 percent pebbles.

A1--0 to 2 inches; brown (10YR 5/3) stony loam, very dark grayish brown (10YR 3/2) moist; moderate very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial pores; 1 percent stones, 2 percent cobbles and 25 percent hard tuff and rhyolitic pebbles; neutral (pH 6.6); clear wavy boundary.

A2--2 to 10 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; soft, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; 20 percent hard tuff and rhyolitic pebbles; neutral (pH 6.8); clear wavy boundary.

Bt1--10 to 26 inches; brown (10YR 5/3) very gravelly clay loam, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; 40 percent hard rhyolitic and tuff pebbles; few thin clay films on faces of peds and lining pores; neutral (pH 7.0); clear wavy boundary.

Bt2--26 to 38 inches; brown (7.5YR 5/4) very gravelly clay loam, dark brown (7.5YR 4/4) moist; weak medium and coarse subangular blocky structure; hard, very friable, sticky and plastic; common very fine and fine and few medium roots; many very fine tubular pores; 5 percent cobbles and 40 percent hard rhyolitic and tuff pebbles; common thin clay films on faces of peds and lining pores; neutral (pH 7.0); abrupt irregular boundary.

Cr--38 to 46 inches; highly fractured weathered andesitic pyroclastic tuff rock; few thin glass coats; few very fine roots in some fractures.

Type location: Washoe County, Nevada. On the northeast side of Massacre Mountain in an unsectioned area. T. 42 N., R. 21 E.; (41 degrees, 31 minutes, 22 seconds north latitude and 119 degrees, 34 minutes, 02 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually moist, moist in winter and spring, dry in late summer and fall.

Soil temperature: 44 to 47 degrees F.

Average summer soil temperature: 54 to 59 degrees F.

Depth to weathered bedrock: 20 to 40 inches.

Mollic epipedon: 20 to 30 inches and includes all or part of the argillic.

Mineralogy: 50 to 80 percent glass in the very fine and fine sand size throughout.

Reaction: Slightly acid or neutral.

Control section:

Clay content--25 to 30 percent.

Rock fragments--35 to 50 percent pebbles that are dominantly hard rhyolitic and tuff rocks when mixed.

A horizons:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Bt horizons:

Hue--10YR or 7.5YR.

Value--4 or 5 dry, 3 or 4 moist.

Chroma--3 through 4.

Texture--Loam or clay loam.

Rock fragments--35 to 50 percent, dominantly pebbles and a few cobbles of hard tuff and rhyolitic rocks.

Uhaldi Series

The Uhaldi series consists of moderately deep, well drained soils that formed in mixed colluvium from tuffaceous sandstone or mudstone. Uhaldi soils are on rock pediments. Slopes are 4 to 30 percent. Mean annual precipitation is about 11 inches, and mean annual temperature is 46 degrees F.

Taxonomic class: Fine-loamy, mixed, mesic Aridic Argixerolls

Typical pedon: Uhaldi stony loam, in map unit 1245, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with about 1 percent stones, 3 percent cobbles, and 30 percent pebbles.

A1--0 to 4 inches; brown (10YR 5/3) stony loam, dark brown (10YR 3/3) moist; strong thin platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine vesicular pores; 1 percent stones, 3 percent cobbles, 30 percent pebbles; slightly acid (pH 6.2); abrupt wavy boundary.

Bt1--4 to 12 inches; brown (7.5YR 5/3) gravelly loam, dark brown (7.5YR 3/3) moist; moderate fine subangular blocky structure; hard, very friable, sticky and plastic; many very fine and common fine and medium roots; many very fine tubular pores; common thin clay films on faces of peds and in pores; 25 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bt2--12 to 22 inches; yellowish brown (10YR 5/4) gravelly clay loam, dark brown (7.4YR 4/4) moist; strong medium and coarse subangular blocky structure; hard, very friable, sticky and plastic; common very fine and fine and few medium roots; many very fine and common fine tubular pores; common thin and few moderately thick clay films on faces of peds and in pores; 20 percent pebbles; slightly alkaline (pH 7.6); clear irregular boundary.

Cr1--22 to 33 inches; brownish yellow (10YR 6/6) weathered tuffaceous sandstone, strong brown (7.5YR 4/6) moist; strong very thick platy rock structure; many very fine roots in some fractures; few large very thin lime coats on underside of some plates; clear irregular boundary.

Cr2--33 to 46 inches; white (N 8/) weathered tuffaceous sandstone, grayish brown (2.5Y 5/2) moist fractured into 4 to 6 inch thick plates; few large very thin lime coats on underside of some plates.

Type location: Washoe County, Nevada; about 2 miles west of the Sheldon Antelope Refuge boundary along Road 8A in an unsectioned area. T. 43 N., R. 22 E.; (41

degrees, 37 minutes, 00 seconds north latitude and 119 degrees, 31 minutes, 03 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry; moist in winter and spring, dry summer and fall.

Soil temperature: 47 to 50 degrees F.

Mollic epipedon: 12 to 16 inches thick, includes the upper part of the argillic horizon.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Percent clay--27 to 35 percent.

Rock fragments--15 to 35 percent, mainly pebbles.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--1 through 3.

Rock fragments--0 to 35 percent cobbles and stones, 15 to 35 percent pebbles.

Reaction--Moderately acid through neutral.

Bt horizon:

Hue--10YR or 7.5YR.

Value--5 or 6 dry, 2 through 4 moist.

Chroma--2 through 4.

Reaction--Slightly acid to slightly alkaline.

Texture--Loam or clay loam in the Bt1, clay loam below.

Percent clay--When mixed, 27 to 35 percent.

Cr horizon:

Other features--Bedded weathered tuffaceous sandstone or mudstone that can be dug with tile spade. Roots penetrate weak fracture planes.

Secondary lime accumulation--None to few very thin or thin lime coats on underside of some fracture planes or plates.

Udike Series

The Udike series consist of very deep moderately well drained soils that formed in mixed alluvium. The Udike soils are on low terraces and have slopes of 0 to 2 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Typic Natrargids

Typical pedon: Udike silt loam in map unit 1310, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; light gray (10YR 7/2) silt loam, dark brown (10YR 4/3) moist; strong thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine tubular and vesicular pores; strongly effervescent; moderately alkaline (pH 8.2); abrupt wavy boundary.

Bt1--4 to 9 inches; pale brown (10YR 6/3) silty clay, dark brown (10YR 4/3) moist; strong fine and medium

subangular blocky structure; hard, firm, very sticky and very plastic; few very fine and fine roots; common very fine tubular pores; many thin clay films on faces of peds and in pores; strongly effervescent; strongly alkaline (pH 8.6); clear smooth boundary.

Bt2--9 to 13 inches; pale brown (10YR 6/3) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong fine and medium subangular blocky structure; hard, friable, very sticky and very plastic; few fine and medium roots; common very fine tubular pores; many moderately thick clay films on faces of peds and in pores; strongly effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

C--13 to 22 inches; pale brown (10YR 6/3) silty clay loam, dark brown (10YR 4/3) moist; strong fine and medium subangular blocky structure; hard, friable, very sticky and very plastic; common few fine roots; common very fine tubular pores; few thin clay films in pores and bridges; strongly effervescent; strongly alkaline (pH 9.0); clear wavy boundary.

Ck1--22 to 29 inches; very pale brown (10YR 7/3) silty clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; slightly hard, very friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; common medium soft masses of lime; violently effervescent; strongly alkaline (pH 9.0); clear smooth boundary.

Ck2--29 to 36 inches; very pale brown (10YR 7/3) silty clay loam, dark brown (10YR 4/3) moist; massive; slightly hard, very friable, very sticky and very plastic; few very fine roots; common very fine tubular pores; common medium soft masses of lime; violently effervescent; strongly alkaline (pH 9.0); abrupt wavy boundary.

2C--36 to 60 inches; light gray (2.5Y 7/2) stratified clay, clay loam and sandy clay loam, light brownish gray (2.5Y 6/2) moist; massive; hard, very friable, very sticky and sticky and very plastic and plastic; common very fine tubular pores; violently effervescent; very strongly alkaline (pH 9.1).

Type location: Washoe County, Nevada; about 12 miles north of Vya at the north end of Long Valley; about 1,200 feet east and 2,400 feet south of the northwest corner of section 2, T. 44 N., R. 19 E.; (41 degrees, 45 minutes, 47 seconds north latitude and 119 degrees, 49 minutes, 24 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in the winter and spring, dry from summer to mid fall.

Soil temperature: 49 to 52 degrees F.

Reaction: Moderately alkaline to very strongly alkaline

Effervescence: Slightly effervescent to violently effervescent

A horizon:

Value--6 or 7 dry, 4 or 5 moist

Chroma--2 or 3

Bt1 horizons:

Hue--10YR or 7.5YR

Value--5 through 7 dry, 4 or 5 moist

Chroma--2 through 4

Texture--Clay or sandy clay, but includes silty clay or silty clay loam
SAR--13 to 45

C horizons:

Hue--10YR or 2.5Y
Value--5 through 7 dry, 3 through 6 moist
Chroma--2 through 4

Valmy Series

The Valmy series consists of very deep, well drained soils that formed in a thin loess cap high in volcanic ash superimposed over loamy alluvium. The Valmy soils are on inset fans and fan skirts. Slopes are 0 to 8 percent. The mean annual precipitation is about 8 inches and the mean annual temperature is about 51 degrees F.

Taxonomic class: Coarse-loamy, mixed (calcareous), mesic Haploduridic Torriorthents

Typical pedon: Valmy fine sandy loam, in map unit 1141, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 2 inches; pale brown (10YR 6/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak very thin platy structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and few fine roots; many very fine interstitial pores; moderately alkaline (pH 8.0); abrupt wavy boundary.

C--2 to 10 inches; light gray (10YR 7/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; moderate medium platy structure; hard, very friable, nonsticky and nonplastic; common very fine roots; many very fine vesicular pores; strongly alkaline (pH 8.5); abrupt wavy boundary.

Cqk1--10 to 15 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure; hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 50 percent 0.5 to 2 inch hard, firm durinodes; many thin silica coats bridging sand grains; few thin silica films in pores; few fine soft lime masses; slightly effervescent; strongly alkaline (pH 8.5); clear smooth boundary.

Cqk2--15 to 22 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark brown (10YR 4/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine tubular pores; 30 percent 0.5 to 1 inch hard, firm durinodes that are olive brown (2.5Y 4/3) moist; lime is disseminated; strongly effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Cqk3--22 to 36 inches; light yellowish brown (10YR 6/4) sandy loam, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine and medium roots; many very fine tubular pores; 5 percent 0.5 to 2 inch hard, firm durinodes; common thin silica films bridging mineral grains; violently effervescent; few fine white (10YR 8/2) soft masses of lime; strongly alkaline (pH 8.6); clear wavy boundary.

Ck--36 to 53 inches; light yellowish brown (10YR 6/4) stratified sandy loam and gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 15 percent pebbles; common fine and medium white (10YR 8/2) soft masses of lime; violently effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

2C--53 to 60 inches; light brownish gray (2.5Y 6/2) gravelly sand, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 20 percent pebbles; violently effervescent; strongly alkaline (pH 9.0).

Type location: Washoe County, Nevada; at the south end of Coleman Valley; about 2.5 miles south of the Nevada-Oregon state line and 0.9 miles west of State Route 34, about 200 feet north and 400 feet east of the southwest corner of section 29 T. 47 N., R. 20 E.; (41 degrees, 57 minutes, 35 seconds north latitude and 119 degrees, 46 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist for short periods in winter and spring, dry from May through November.

Soil temperature: 47 to 53 degrees F.

Depth to Cq horizon: 6 to 20 inches. Durinodes range from 5 to 85 percent by volume in any one horizon but one or more horizons more than 6 inches thick contains more than 25 percent.

Depth to unconformity: 30 to 50 inches, with some pedons deeper than 50 inches to sandy material. Some pedons have a stratified substratum.

Control section:

Clay content--5 to 15 percent.

Rock fragments--0 to 30 percent, mainly pebbles.

A horizon:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 3 through 5 moist.

Reaction--Moderately alkaline or strongly alkaline.

C horizons:

Hue--10YR or 2.5Y.

Value--5 through 7 dry, 4 or 5 moist.

Chroma--2 through 4.

Texture--Mainly fine sandy loam or sandy loam, but includes strata of very fine sandy loam or coarse sandy loam in some pedons.

Durinodes--Hard to extremely hard, very friable to very firm and brittle, nonsticky or slightly sticky and nonplastic or slightly plastic wet.

Reaction--Strongly alkaline or very strongly alkaline.

Effervescence--Slightly effervescent to violently effervescent.

2C horizons:

Texture--Gravelly sand or very gravelly sand; substratum phases have textures of silty clay loam below 40 inches, or are stratified very fine sandy loam to gravelly silt loam.

Clay content--1 to 18 percent.

Structure--Single grained, massive or platy.
 Consistence--Loose or slightly hard or hard dry,
 nonsticky or sticky wet.
 Rock fragments--5 to 55 percent.
 Reaction--Strongly alkaline or very strongly alkaline.

Verdico Series

The Verdico series consists of moderately deep, well drained soils that formed in fluvial sediments and pediments, residuum and colluvium from water laid tuff on plateaus and side slopes of hills, strath terraces and pediments. Slopes are 4 to 15 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 49 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Vertic Paleargids

Typical pedon: Verdico very stony sandy loam, in map unit 1090, rangeland. (Colors are for dry soil unless otherwise noted). The soil surface is covered with 10 percent stones, 10 percent cobbles, and 20 percent pebbles.

A--0 to 3 inches; pale brown (10YR 6/3) very stony sandy loam, brown (10YR 4/3) moist; moderate thin and medium platy structure; slightly hard, very friable, sticky and plastic; few fine tubular pores, common medium vesicular pores; 10 percent stones, 10 percent cobbles, 20 percent pebbles; slightly acid (pH 6.4); abrupt wavy boundary.

Bt1--3 to 13 inches; light yellowish brown (10YR 6/4) clay, yellowish brown (10YR 5/4) moist; weak medium prismatic structure parting to strong fine and medium angular blocky; hard, very friable, very sticky and very plastic; common fine and very fine and few medium roots; few very fine tubular pores; common thin grayish brown (10YR 5/1) clay films, very dark grayish brown (10YR 3/2) moist on faces of peds and in pores; 5 percent pebbles; 5 percent cobbles; neutral (pH 7.0); clear wavy boundary.

Bt2--13 to 17 inches; light yellowish brown (10YR 6/4) clay; yellowish brown (10YR 5/4) moist; moderate medium prismatic structure parting to strong fine and medium angular blocky; hard, firm, very sticky and very plastic; few fine and common medium roots; few very fine tubular pores; many thin and moderately thick clay films on faces of peds and in pores; many pressure faces; 10 percent pebbles; neutral (pH 7.0); clear wavy boundary.

2Ck--17 to 22 inches; light yellowish brown (10YR 6/4) gravelly clay, dark yellowish brown (10YR 4/4) moist; moderate very fine, fine and medium subangular blocky structure; hard, very friable, very sticky and very plastic; few fine and medium roots; few very fine tubular pores; few fine soft masses of lime; 25 percent pebbles; slightly effervescent; slightly alkaline (pH 7.5); gradual wavy boundary.

Cr--22 to 26 inches; white (10YR 8/2) weathered tuff, very pale brown (10YR 7/4) moist; very thick platy rock structure; many thin silica and lime coats between plates.

Type location: Washoe County, Nevada; about 2,100 feet north and 1,600 feet west of the southeast corner of section 17, T. 43 N., R. 18 E.; (41 degrees, 38 minutes, 46 seconds north latitude and 119 degrees, 59 minutes, 04 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 52 degrees F.

Solum thickness: 17 to 30 inches.

Reaction: Slightly acid or neutral.

Depth to paralithic contact: 20 to 40 inches.

Control section:

Clay percent--45 to 60.

Rock fragments--0 to 10 percent pebbles.

Other features: Abrupt clay increase of 20 percent or more within a vertical distance of 1 inch or less between the A and Bt horizon. Linear extensibility is 6 centimeters or more.

A horizon:

Value--5 or 6 dry; 3 or 4 moist.

Chroma--2 or 3.

Other features--An increase of 15 percent clay in a vertical depth of 1 inch between the A and Bt horizon.

Bt horizons:

Value--6 or 7 dry, 4 or 5 moist.

Chroma--3 or 4.

Structure--Weak through strong prismatic or prismatic parting to angular blocky.

Other features--Common to many pressure faces.

C horizon:

Value--6 or 7 dry, 4 or 5 moist.

Texture--Clay loam and clay.

Clay content--35 to 50 percent clay.

Rock fragments--15 to 30 percent.

Reaction--Neutral or slightly alkaline.

Carbonates--None to few fine filaments and soft masses.

Weezweed Series

The Weezweed series consists of very deep, moderately well drained soils that formed in alluvium from volcanic rocks and pyroclastic materials. Weezweed soils are on stream terraces. Slopes are 0 to 2 percent. The mean annual precipitation is about 12 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic Vitritorrandic Haploxerolls

Typical pedon: Weezweed loam, in map unit 1460, rangeland (Colors are for dry soil unless otherwise noted).

A1--0 to 5 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate thick

platy structure; slightly hard, very friable, sticky and slightly plastic; common very fine and fine roots; common very fine tubular and interstitial pores; neutral (pH 6.8); clear wavy boundary.

A2--5 to 12 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak coarse prismatic parting to moderate coarse subangular blocky structure; slightly hard, very friable, sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; neutral (pH 6.8); clear wavy boundary.

A3--12 to 16 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak coarse prismatic parting to strong fine and medium subangular blocky structure; slightly hard, very friable, sticky and slightly plastic; common very fine, fine and medium roots; common very fine tubular pores; common thin dark gray (10YR 4/1) strata, black (10YR 2/1) moist; neutral (pH 6.8); clear wavy boundary.

C1--16 to 26 inches; light brownish gray (10YR 6/2) finely stratified sandy loam, dark grayish brown (10YR 4/2) moist; moderate coarse prismatic parting to strong thick platy structure; very hard, friable, slightly sticky and slightly plastic; few very fine through medium roots; few very fine tubular pores; common medium distinct dark yellowish brown (10YR 3/4) relict iron masses, black (10YR 2/1) moist; neutral (pH 6.7); clear wavy boundary.

C2--26 to 42 inches; light brownish gray (10YR 6/2) stratified loam and sandy clay loam, dark grayish brown (10YR 4/2) moist; moderate coarse prismatic parting to strong thick platy structure; very hard, firm, sticky and slightly plastic; few very fine through medium roots; few very fine tubular pores; few fine distinct dark yellowish brown (10YR 3/4) moist relict iron masses, few fine black (10YR 2/1) moist relict manganese masses; slightly acid (pH 6.4); clear wavy boundary.

C3--42 to 60 inches; light yellowish brown (2.5Y 6/3) stratified loam and sandy clay loam, olive brown (2.5Y 4/3) moist; massive; very hard, firm, sticky and slightly plastic; few very fine roots; common very fine tubular pores; common fine distinct black (10YR 2/1) moist relict manganese and grayish brown (2.5Y 5/3) moist relict iron masses; neutral (pH 6.6).

Type location: Washoe County, Nevada; about 1,500 feet southwest of Wall Canyon Ranch; about 100 feet south and 1,300 feet west of the northeast corner of section 4, T. 42 N., R. 23 E.; (41 degrees, 35 minutes, 33 seconds north latitude and 119 degrees, 23 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring; dry from mid-June through October; saturated below 5 feet during late winter and early spring.

Soil temperature: 47 to 50 degrees F.

Thickness of mollic epipedon: 10 to 20 inches, organic matter decreases irregularly with depth.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Control section:

Clay content--18 to 27 percent.

Rock fragments--Less than 10 percent.

Other features: Some pedons have C horizons below depths of 36 inches with stratified textures of sandy loam to silty clay loam. Thin discontinuous strata having up to 35 percent pebbles are present in some pedons.

A horizons:

Hue--10YR or 2.5Y.

Value--4 or 5 dry, 2 or 3 moist.

Chroma--0 through 2.

Reaction--Neutral or slightly alkaline.

C horizons:

Hue--10YR, 2.5Y or 5Y.

Value--6 through 8 dry, 4 or 5 moist.

Chroma--1 through 3.

Structure--Weak or moderate fine to medium prismatic parting to platy or blocky, or is massive.

Texture--Usually stratified gravelly loamy sand to silty clay loam. Dominantly loam or sandy clay loam when mixed.

Redox features--Relic redox concentrations are present in most pedons.

Weimer Series

The Weimer series consists of very deep, poorly drained soils that formed in mixed lacustrine sediments from volcanic sources. Weimer soils are on lakeplains. Slopes are 0 to 2 percent. Mean annual precipitation is about 13 inches and the mean annual temperature is about 43 degrees F.

Taxonomic class: Very-fine, montmorillonitic, frigid Xeric Epiaquerts.

Typical pedon: Weimer clay, in map unit 1380, rangeland. (Colors for dry soils unless otherwise noted). Vertical cracks 1 to 4 inches wide extend from the soil surface to a depth of 26 inches.

A1--0 to 4 inches; dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; strong very fine granular structure; hard, friable, very sticky and very plastic; many very fine and fine roots; many fine interstitial pores; neutral (pH 7.2); clear smooth boundary.

A2--4 to 8 inches; dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; moderate medium and coarse prismatic structure parting to strong fine and medium subangular blocky; very hard, very firm, very sticky and very plastic; many very fine and fine roots; many very fine interstitial and few fine tubular pores; common pressure faces; neutral (pH 7.3); clear smooth boundary.

Bss1--8 to 26 inches; dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; moderate medium and coarse prismatic structure parting to strong medium and coarse angular blocky; very hard, very firm, very sticky and very plastic; many very fine and fine roots; many very fine interstitial and few fine tubular pores; many slickensides; many wedge-shaped aggregates tilted 30 degrees from horizontal; few fine distinct yellowish

brown (10YR 5/4) iron masses on faces of peds; slightly alkaline (pH 7.4); gradual wavy boundary.
Bss2--26 to 48 inches; dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; weak medium and coarse prismatic structure parting to strong medium and coarse angular blocky; very hard, very firm, very sticky and very plastic; few very fine and fine roots; common very fine interstitial and few fine tubular pores; many slickensides; many wedge-shaped aggregates tilted 30 degrees from horizontal; few fine distinct yellowish brown (10YR 5/4) iron masses on faces of peds; slightly effervescent; moderately alkaline (pH 8.4); clear smooth boundary.

Bk--48 to 60 inches; dark gray (10YR 4/1) clay, very dark grayish brown (10YR 3/2) moist; massive; very hard, very firm, very sticky and very plastic; few very fine roots; few very fine and fine tubular pores; common fine and medium white (10YR 8/1) soft masses of lime; slightly effervescent; moderately alkaline (pH 8.4).

Type location: Washoe County, Nevada; in Crooks Meadow; about 1,600 feet east and 2,900 feet south of the northwest corner of section 22, T. 45 N., R. 18 E.; (41 degrees, 48 minutes, 21 seconds north latitude and 119 degrees, 57 minutes, 26 seconds west longitude.)

Range in Characteristics:

Soil moisture: Moist in winter and spring, ponded for very long duration during spring and early summer, dry late summer and fall.

Aquic condition: Saturated from the soil surface to within a depth of 20 inches during spring and early summer.

Soil temperature: 43 to 47 degrees F.

Average summer soil temperature: 61 to 63 degrees F.

Depth to secondary lime accumulation: 20 to 40 inches

Control section:

Clay content--60 to 75 percent

Other features: When dry, vertical cracks 0.5 inches to 4 inches wide extend from the soil surface to a depth of 20 to 30 inches or more. The cracks are closed in winter and spring. Gilgai micro relief is evident in most areas.

A horizons:

Hue--Neutral, 10YR or 2.5Y

Value--4 or 5 dry, 2 through 3.5 moist

Chroma--0 or 1

Electrical conductivity--Less than 1,

Bss horizons:

Hue--Neutral, 10YR or 2.5Y

Value--4 or 5 dry, 2 or 3 moist

Chroma--0 or 1

Structure--Prismatic or angular blocky

Reaction--Slightly alkaline or moderately alkaline.

Effervescence--Noneffervescent or slightly effervescent

Other features--Common or many slickensides and wedge-shaped aggregates. Few or common distinct redox concentrations

Bk horizon:

Hue--Neutral, 10YR or 2.5Y

Value--4 or 5 dry, 2 or 3 moist

Chroma--0 through 2

Texture--Clay or silty clay

Reaction--Moderately alkaline or strongly alkaline

Effervescence--Slightly effervescent or strongly effervescent. None to many fine to large soft masses of lime

Welch Series

The Welch series consists of very deep, very poorly drained soils that formed in alluvium from mixed volcanic rock sources with a component of vitric pyroclastic materials. Welch soils are on flood plains, stream terraces, inset fans and in narrow hill and mountain valleys, bottomland, and drainageways. Slopes are 0 to 15 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Fine-loamy, mixed, frigid Cumulic Endoaquolls

Typical pedon: Welch clay loam, in map unit 1360, meadow. (Colors for dry soils unless otherwise noted.)

A1--0 to 5 inches; very dark gray (10YR 3/1) clay loam, black (10YR 2/1) moist; moderate thin platy structure; slightly hard, friable, sticky and plastic; many very fine roots; many very fine tubular pores; neutral (pH 6.6); abrupt smooth boundary.

A2--5 to 16 inches; very dark gray (10YR 3/1) silty clay loam, black (10YR 2/1) moist; moderate very fine and fine granular structure; hard, friable, sticky and plastic; few fine, and many very fine roots; many very fine tubular and interstitial pores; neutral (pH 6.8); gradual smooth boundary.

A3--16 to 28 inches; dark gray (N 4/0) sandy clay loam, black (10YR 2/1) moist; weak medium prismatic structure; hard, friable, sticky and plastic; few fine and very fine roots; few fine tubular and many very fine interstitial and tubular pores; few fine distinct dark yellowish brown (10YR 4/4) iron concentrations in pores, dark yellowish brown (10YR 3/4) moist; neutral (pH 6.8); gradual smooth boundary.

A4--28 to 43 inches; dark gray (N 4/0) sandy clay loam, black (N 2/0) moist; massive; hard, firm, sticky and plastic; few very fine and fine roots; few fine tubular, and many very fine interstitial and tubular pores; neutral (pH 6.8); gradual smooth boundary.

Cg--43 to 60 inches; gray (5Y 5/1) sandy clay loam, very dark gray (5Y 3/1) moist; massive; hard, friable, sticky and plastic; few very fine and fine roots; few fine tubular and many very fine interstitial and tubular pores; neutral (pH 6.8).

Type location: Washoe County, Nevada; about 150 feet west and 2,000 feet south of the northeast corner of section 1, T. 42 N., R. 18 E.; (41 degrees, 35 minutes, 29 seconds north latitude and 119 degrees, 54 minutes, 25 seconds west longitude.)

Range in Characteristics:

Soil moisture: Welch soils are saturated and have aquic conditions at or near the surface for a least one month during most years, mainly during the late winter and early spring months, water table drops to a depth of 18 to 36 inches from early spring through September.

Soil temperature: 41 to 46 degrees F.

Mollic epipedon thickness: 26 to over 60 inches, organic matter decreases irregularly with depth.

Control section: Clay content--27 to 35 percent, when mixed.

Mineralogy:--Mixed, but the parent material has a large component of vitric pyroclastic materials.

Other features: Buried A horizons are common. Some pedons have gravelly strata or strata of silty clay loam, silt loam, clay, loam, very fine sandy loam or sandy loam.

A horizons:

Hue--10YR through 5Y or neutral.

Value--3 through 5 dry, 2 or 3 moist.

Chroma--0 through 3 in the upper part and 0 through 2 in the lower part.

Reaction--Slightly acid or neutral.

Other features--Few to many fine or medium redoximorphic concentrations either as pore linings or masses.

C horizons:

Hue--10YR, 2.5Y, 5Y or neutral.

Value--5 through 8 dry, 3 through 5 moist.

Chroma--0 through 2.

Structure--Massive or prismatic.

Texture--Stratified dominantly sandy clay loam or clay loam.

Consistence--Slightly hard or hard dry, very friable or friable moist. Slightly sticky or sticky and slightly plastic or plastic.

Reaction--Slightly acid to slightly alkaline.

Other features--None to many fine to coarse redox concentrations or depletions either as masses or pore linings.

A1--0 to 3 inches; light gray (10YR 7/1) silt loam, grayish brown (10YR 5/2) moist; moderate very thin platy structure; slightly hard, very friable, slightly sticky and plastic; few very fine roots; many very fine vesicular and tubular pores; strongly effervescent; very strongly alkaline (pH 9.6); abrupt smooth boundary.

A2--3 to 10 inches; light gray (10YR 7/2) silt loam, brown (10YR 4/3) moist; moderate very thin and thin platy structure; hard, very friable, sticky and plastic; few very fine and fine roots; many very fine tubular pores; strongly effervescent; very strongly alkaline (pH 9.6); clear wavy boundary.

C--10 to 15 inches; light gray (10YR 7/2) silt loam, brown (10YR 4/3) moist; massive; hard, very friable, sticky and plastic; common very fine and few fine and medium roots; many very fine and few fine tubular pores; strongly effervescent; very strongly alkaline (pH 9.6); clear wavy boundary.

Cqk1--15 to 21 inches; white (10YR 8/2) silt loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, sticky and plastic; common very fine and few fine and medium roots; many very fine and few fine tubular pores; 20 percent weak, 10 to 30 millimeter durinodes; lime is disseminated; strongly effervescent; strongly alkaline (pH 8.6); clear wavy boundary.

Cqk2--21 to 27 inches; white (10YR 8/1) very fine sandy loam (volcanic ash), light gray (10YR 7/2) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine and fine tubular pores; 10 percent weak, 5 to 20 millimeter durinodes; 20 percent weak discontinuous silica cementation; lime is disseminated; strongly effervescent; moderately alkaline (pH 8.4); abrupt wavy boundary.

Ck--27 to 40 inches; light brownish gray (10YR 6/2) silty clay loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, sticky and plastic; few very fine roots; many very fine and common fine tubular pores; continuous thin clay films lining pores; common fine distinct strong brown (7.5YR 5/6) redox concentrations, brown (7.5YR 4/4) moist; slightly effervescent; few fine filaments of secondary carbonates; strongly alkaline (pH 8.6); clear wavy boundary.

Ab--40 to 48 inches; light gray (10YR 6/1) silty clay loam, very dark grayish brown and dark grayish brown (10YR 3/2 and 4/2) moist; massive; hard, friable, sticky and very plastic; few very fine roots; many very fine and few fine and medium tubular pores; continuous thin clay films lining pores; few snail shells evident; slightly effervescent; strongly alkaline (pH 8.6); clear irregular boundary.

C--48 to 65 inches; pale brown (10YR 6/3) clay loam, brown (10YR 4/3) moist; massive; hard, friable, sticky and very plastic; few very fine roots; many very fine and few fine tubular pores; continuous thin clay films lining pores; 10 percent fine and medium pebbles; slightly effervescent; moderately alkaline (pH 8.4).

Type location: Washoe County, Nevada; near the Humboldt County line; west of High Rock Lake in an unsectioned area, T. 39 N., R. 23 E.; (41 degrees, 16 minutes, 54 seconds north latitude and 119 degrees, 18 minutes, 16 seconds west longitude.)

Wendane Series

The Wendane series consists of very deep, somewhat poorly drained soils that formed in silty alluvium from mixed rocks, loess, and volcanic ash. The Wendane soils are on alluvial flats, stream terraces and smooth flood plains. Slopes are 0 to 4 percent. The mean annual precipitation is about 7 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Fine-silty, mixed (calcareous), mesic Aeric Halaquepts

Typical pedon: Wendane silt loam, in map unit 1145, rangeland. (Colors are for dry soil unless otherwise noted.)

Range in Characteristics:

Soil moisture: Saturated within depths of 28 to 40 inches during the spring of most years. Dry mid-summer through mid-winter moist in mid-winter, spring, and early summer. Apparent seasonal water table is between 2.5 and 4 feet between February and July.

Soil temperature: 47 to 52 degrees F.

Mineralogy: Mixed, but has a strong influence from volcanic ash and other pyroclastic materials.

Depth to Cqk horizon: 11 to 20 inches.

Depth to redoximorphic concentrations: 8 to 27 inches.

Electrical conductivity: 16 to 32 millimhos per centimeter throughout.

SAR: 46 to 99 in half or more of the upper 20 inches and decreases with depth.

Profile reaction: Moderately alkaline to very strongly alkaline.

Other features: Unconformable stratified gravelly sand or very gravelly sand are common in some pedons below 40 inches. Some pedons have Cq horizons that are noneffervescent below 40 inches.

Control section:

Clay content--20 to 30 percent, when mixed.

A horizon:

Value--6 or 7 dry, 4 through 6 moist.

Chroma--1 through 4.

SAR--46 to 99

C and Cqk horizons:

Hue--10YR or 2.5Y.

Value--6 through 8 dry, 4 through 7 moist.

Chroma--1 through 4.

Texture--Stratified very fine sandy loam, silt loam, silty clay loam, and clay loam.

Structure--Thin platy or is massive. Prismatic parting to angular blocky in some subhorizons.

SAR--Less than 12.

Other features--Strata of volcanic ash that are 4 to 10 inches thick are common at some depth between 13 and 36 inches.

Cementation (Cqk horizons)--10 to 40 percent weakly or strongly cemented durinodes in a friable matrix and up to 30 percent discontinuous weak silica cementation in any one horizon.

noted.) The soil surface is covered with about 2 percent stones, 10 percent cobbles, and 20 percent pebbles.

A--0 to 3 inches; dark grayish brown (10YR 4/2) stony loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots; many very fine interstitial and tubular pores; 1 percent stones, 10 percent cobbles and 20 percent pebbles; neutral (pH 7.2); abrupt wavy boundary.

AB--3 to 7 inches; grayish brown (10YR 5/2) very cobbly loam, very dark brown (10YR 2/2) moist; moderate very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine interstitial and tubular pores; 1 percent stones, 20 percent cobbles and 25 percent pebbles; neutral (pH 7.2); clear wavy boundary.

Bw1--7 to 14 inches; brown (10YR 5/3) very cobbly loam, dark brown (10YR 3/3) moist; strong fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine and common fine tubular pores; 20 percent cobbles and 20 percent pebbles; slightly alkaline (pH 7.4); clear wavy boundary.

Bw2--14 to 22 inches; grayish brown (10YR 5/3) very cobbly loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine and common fine tubular pores; 20 percent cobbles and 30 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bw3--22 to 28 inches; yellowish brown (10YR 5/4) extremely cobbly loam, dark brown (10YR 3/3) moist; weak medium and coarse subangular blocky structure; hard, very friable, sticky and plastic; common very fine and few fine roots; many very fine tubular pores; 5 percent stones, 25 percent cobbles and 40 percent pebbles; slightly alkaline (pH 7.6); abrupt irregular boundary.

R--28 to 32 inches; Hard fractured andesite.

Type location: Washoe County, Nevada; about 700 feet west and 2,100 feet north of the southeast corner of section 20, T. 47 N., R. 19 E.; (41 degrees, 58 minutes, 44 seconds north latitude and 119 degrees, 52 minutes, 08 seconds west longitude.)

Westbutte Series

The Westbutte series consists of moderately deep, well drained soils that formed in colluvium weathered from basalt, tuff and andesite. Westbutte soils are on hills and plateaus. Slopes are 4 to 50 percent. The mean annual precipitation is about 14 inches and the mean annual temperature is about 42 degrees F.

Taxonomic class: Loamy-skeletal, mixed, frigid Pachic Haploxerolls

Typical pedon: Westbutte stony loam, in map unit 1346, rangeland. (Colors are for dry soil unless otherwise

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 40 to 47 degrees F.

Depth to bedrock: 20 to 40 inches

Thickness of mollic: 20 to 40 inches

Reaction: Neutral or slightly alkaline

Control section:

Clay content--18 to 30 percent

Rock fragments--35 to 50 percent

A horizons:

Value--3 through 5 dry, 2 or 3 moist

Chroma--1 or 2

AB horizons:

Value--4 or 5 dry, 2 or 3 moist

Bw horizons:

Hue--10YR or 7.5YR

Value--4 or 5 dry, 2 or 3 moist

Chroma--2 through 4 dry, 2 or 3 moist

Structure--Subangular blocky or granular

Rock fragments--0 to 20 percent stones, 20 to 50 percent cobbles and 5 to 30 percent pebbles

Wetvit Series

The Wetvit series consists of very deep, very poorly drained soils that formed in alluvium from volcanic rocks and pyroclastic materials. Wetvit soils are on relatively narrow flood plains adjacent to plateaus and mountains. Slopes are 0 to 2 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 46 degrees F.

Taxonomic class: Ashy, mesic Aquandic Endoaquolls

Typical pedon: Wetvit fine sandy loam, meadow, in map unit 1450 (Colors are for dry soil unless otherwise noted). The surface is covered with about 10 percent pebbles.

A1--0 to 16 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium platy structure; hard, very friable, slightly sticky and nonplastic; many very fine and fine roots; common very fine tubular pores; few fine distinct dark brown (7.5YR 4/4) moist iron masses; slightly acid (pH 6.2); clear smooth boundary.

A2--16 to 25 inches; gray (10YR 5/1) fine sandy loam, very dark gray (10YR 3/1) moist; weak medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, slightly sticky and slightly plastic; common fine and very fine roots; common very fine tubular pores; common fine distinct dark yellowish brown (10YR 3/4) moist iron masses; slightly acid (pH 6.4); clear smooth boundary.

A3--25 to 35 inches; dark gray (10YR 4/1) stratified loam, black (10YR 2/1) moist; weak medium prismatic structure parting to moderate medium subangular blocky; very hard, firm, sticky and plastic; few fine and very fine roots; common very fine and fine tubular pores; common fine distinct dark brown (7.5YR 3/4) moist iron concentrations in masses and in pores; slightly acid (pH 6.4); clear smooth boundary.

A4--35 to 44 inches; gray (10YR 5/1) stratified loam, very dark gray (10YR 3/1) moist; weak medium prismatic structure parting to moderate medium subangular blocky; hard, very friable, sticky and plastic; few very fine roots; common very fine tubular pores; common fine and medium distinct olive brown (2.5Y 4/3) and few fine distinct strong brown (7.5YR 4/6) iron concentrations in masses and in pores; neutral (pH 6.6); abrupt smooth boundary.

2C1--44 to 50 inches; gray (10YR 6/1) loamy sand, dark gray (10YR 4/1) moist; massive; soft, very friable,

nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; common fine olive (5Y 4/4) iron concentrations in masses and in pores; neutral (pH 6.6); abrupt smooth boundary.

3C2--50 to 60 inches; light brownish gray (2.5Y 6/2) stratified sandy clay loam and loam, light olive brown (2.5Y 5/3) moist; massive; hard, very friable, sticky and plastic; few very fine roots; common very fine tubular pores; many coarse distinct gray (N 5/), common fine and medium distinct olive (5Y 4/4) and few coarse greenish gray (5G 5/1) iron concentrations and clay depletions in masses and in pores; neutral (pH 6.6).

Type location: Washoe County, Nevada; In Hanging Rock Canyon; about 2,500 feet east and 2,200 feet south of the northwest corner of section 31, T. 42 N., R. 23 E.; (41 degrees, 30 minutes, 45 seconds north latitude and 119 degrees, 25 minutes, 48 seconds west longitude.)

Range in Characteristics:

Soil moisture: Wetvit soils are saturated due to a seasonal water table at a depth of 0 to 18 inches mainly during the late winter and early spring months.

Soil temperature: 47 to 50 degrees F.

Mollic epipedon thickness: 26 to 48 inches, organic matter decreases irregularly with depth.

Control section:

Clay content--18 to 27 percent, when mixed.

Texture--Dominantly stratified loam or sandy clay loam, with strata of fine sandy loam or clay loam present in some pedons.

Rock fragments--Less than 15 percent.

Mineralogy: 35 to 60 percent glass in the very fine and fine sand size throughout.

Other features: Buried A horizons are common. Some pedons have gravelly strata or strata of silty clay loam, silt loam, clay loam, very fine sandy loam or sandy loam. Due to aeolian dust, some pedons are calcareous in the surface layer.

A horizons:

Hue--10YR, 2.5Y, 5Y or neutral.

Value--3 through 5 dry, 2 or 3 moist.

Chroma--0 through 2.

Reaction--Slightly acid to slightly alkaline.

Other features--Few to many redoximorphic concentrations either as pore linings or masses are present within 17 inches.

C horizons:

Hue--10YR, 2.5Y, 5Y or neutral.

Value--5 through 8 dry, 3 through 5 moist.

Chroma--0 through 3.

Reaction--Neutral or slightly alkaline.

Structure--Massive or prismatic.

Texture--Stratified loam with strata of gravelly loamy sand to clay loam.

Other features--None to many fine to coarse redoximorphic concentrations or depletions either as masses or pore linings.

Wylo Series

The Wylo series consists of shallow, well drained soils that formed in residuum and lesser amounts of colluvium from basalt and andesite. The Wylo soils are on summits and side slopes of plateaus and hills. Slopes are 8 to 30 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 50 degrees F.

Taxonomic class: Clayey, montmorillonitic, mesic Lithic Argixerolls

Typical pedon: Wylo very stony loam, in map unit 1160, rangeland. (Colors are for dry soil unless otherwise noted.) The soil surface is partially covered with 10 percent stones, 5 percent cobbles, and 25 percent pebbles.

A--0 to 4 inches; brown (7.5YR 5/2) very stony loam, dark brown (7.5YR 3/2) moist; moderate medium platy structure parting to weak fine subangular blocky; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; few very fine vesicular pores and common very fine tubular pores; 5 percent stones, 5 percent cobbles, 25 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt1--4 to 7 inches; brown (7.5YR 5/2) gravelly clay loam, dark brown (7.5YR 3/2) moist; moderate fine and medium angular blocky structure; slightly hard, very friable, sticky and plastic; common very fine and fine roots; common very fine tubular pores; many thin and few moderately thick clay films on faces of peds and in pores; 10 percent cobbles, 20 percent pebbles; neutral (pH 7.0); clear smooth boundary.

Bt2--7 to 11 inches; brown (7.5YR 5/2) gravelly clay, dark brown (7.5YR 4/2) moist; moderate fine and medium prismatic structure parting to strong fine and medium angular blocky; very hard, friable, very sticky and very plastic; few very fine and fine roots; common very fine tubular pores; many moderately thick and thick clay films on faces of peds and in pores; 10 percent cobbles, 20 percent pebbles; neutral (pH 7.0); clear wavy boundary.

Bt3--11 to 15 inches; brown (7.5YR 5/4) gravelly clay, dark brown (7.5YR 4/4) moist; strong fine angular blocky structure; very hard, friable, very sticky and very plastic; few very fine and fine roots; few very fine tubular pores; many moderately thick and thick clay films on faces of peds; 10 percent cobbles, 20 percent pebbles; neutral (pH 7.0); abrupt irregular boundary.

R--15 to 19 inches; hard fractured basalt.

Type location: Washoe County, Nevada; about 2.75 miles north of High Rock Canyon; about 2.0 miles west of the Humboldt County line; about 2,200 feet north and 300 feet east of southwest corner of section 14 T, 40 N., R. 23 E.; (41 degrees, 22 minutes, 19 seconds north latitude and 119 degrees, 20 minutes, 26 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist winter, spring and early summer; dry July through October.

Soil temperature: 54 to 59 degrees F.

Depth to bedrock: 14 to 20 inches.

Mollic epipedon thickness: 7 to 11 inches, includes upper part of argillic horizon.

Profile reaction: Neutral or slightly alkaline.

Control section:

Clay content--35 to 50 percent.

Rock fragments--15 to 35 percent.

A horizon:

Hue--7.5YR or 10YR.

Chroma--2 or 3 dry or moist.

Bt horizons:

Hue--7.5YR or 10YR.

Value--3 or 4 moist, 4 or 5 dry.

Chroma--Dominantly 2 or 3 in upper part, 3 or 4 in lower part, moist or dry.

Texture--Dominantly clay or clay loam in the upper part.

Clay content--Individual subhorizons range from 35 to 55 percent, average is 35 to 50 percent.

Rock fragments--Average 15 to 35 percent, individual subhorizons may range up to 45 percent.

Yellowhills Series

The Yellowhills series consists of very deep, well drained soils that formed in alluvium high in volcanic ash. The Yellowhills soils are on inset fans. Slopes are 0 to 2 percent. The mean annual precipitation is about 11 inches and the mean annual temperature is about 45 degrees F.

Taxonomic class: Ashy, mesic Vitritorrandic Haploxerolls

Typical pedon: Yellowhills sandy loam, in map unit 1151, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 2 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular and vesicular pores; neutral (pH 6.8); clear smooth boundary.

A2--2 to 16 inches; brown (10YR 5/3) sandy loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; neutral (pH 6.8); clear smooth boundary.

Bw--16 to 34 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores; neutral (pH 6.8); clear smooth boundary.

Bq--34 to 60 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine

and fine roots; many very fine tubular pores; 10 percent weakly cemented durinodes; neutral (pH 7.0).

Type location: Washoe County, Nevada, near the Humboldt county line, about 100 feet north and 1,800 feet east of the southwest corner of section 36 T. 39 N., R. 23 E.; (41 degrees, 14 minutes, 07 seconds north latitude; 119 degrees, 19 minutes, 08 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring; dry from late June through October.

Soil temperature: 43 to 46 degrees F.

Mollic epipedon thickness: 10 to 20 inches.

Depth to Bq horizons: 25 to 40 inches.

Reaction: Neutral or slightly alkaline.

Control section:

Clay content--8 to 15 percent.

Rock fragments--0 to 15 percent.

Volcanic glass content: 60 to 80 percent of the 0.02 to 2 mm fraction.

A horizons:

Chroma--2 or 3

Bw horizon:

Value--3 or 4 moist.

Chroma--3 or 4.

Texture--Sandy loam or fine sandy loam.

Clay content--8 to 15 percent.

Rock fragments--0 to 15 percent.

Bq horizon:

Value--3 or 4 moist.

Chroma--3 or 4.

Texture--Sandy loam or fine sandy loam.

Clay content--8 to 15 percent.

Rock fragments--0 to 15 percent.

Consistence--Soft or slightly hard, very friable or friable.

Other features--Has 5 to 15 percent weakly cemented durinodes or has few thin strata of discontinuous weak cementation. Some pedons have segregated lime.

Zorravista Series

The Zorravista series consists of very deep, excessively drained soils that formed in mixed aeolian material. The Zorravista soils are on semi-stabilized sand dunes and sand sheets superimposed on beach terraces. Slopes are 4 to 15 percent. The mean annual precipitation is about 9 inches and the mean annual temperature is about 48 degrees F.

Taxonomic class: Mixed, mesic Xeric Torripsamments

Typical pedon: Zorravista fine sand, in map unit 1030, rangeland. (Colors are for dry soil unless otherwise noted.)

A--0 to 4 inches; light brownish gray (2.5Y 6/2) fine sand, very dark grayish brown (2.5Y 3/2) moist; single grain; loose when dry and moist; few micro roots; many very fine and fine interstitial pores; strongly effervescent; moderately alkaline (pH 8.2); clear smooth boundary.

C1--4 to 29 inches; light brownish gray (2.5Y 6/2) fine sand, dark grayish-brown (2.5Y 4/2) moist; single grain; loose when dry and moist; very fine and few fine roots; many very fine and fine interstitial pores; slightly effervescent; moderately alkaline (pH 8.0); diffuse smooth boundary.

C2--29 to 60 inches; light brownish gray (2.5Y 6/2) fine sand, dark grayish brown (2.5Y 4/2) moist; single grained; loose when dry and moist; many micro and few very fine and fine roots; many very fine and fine interstitial pores; slightly effervescent; moderately alkaline (pH 8.0).

Type location: Washoe County, Nevada; about 3.5 miles southeast of Painted Point; about 2.5 miles south of Road 8A near Sand Spring in an unsectioned area. (41 degrees, 32 minutes, 52 seconds north latitude and 119 degrees, 40 minutes, 09 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, dry mid spring through fall, moist winter and early spring.

Soil temperature: 47 to 52 degrees F.

Control section:

Clay content--Less than 5 percent.

Other features--Effervescent to at least 20 inches.

A horizon:

Hue--10YR, 2.5Y.

Value--6 or 7 dry, 3 through 6 moist.

Chroma--1 through 4.

Reaction--Moderately alkaline or strongly alkaline.

Effervescence--Slightly effervescent or strongly effervescent.

C horizons:

Hue--10YR or 2.5Y.

Consistence--Soft to slightly hard or loose dry, very friable or loose moist.

Value--5 through 8 dry, 3 through 6 moist.

Chroma--1 through 4.

Texture--Fine sand, sand or loamy fine sand.

Clay content--Less than 5 percent in the upper part.

Reaction--Mildly alkaline through strongly alkaline.

Structure--Single grained or massive.

Effervescence--Noneffervescent to strongly effervescent.

Zymans Series

The Zymans series consists of deep and very deep, well drained soils that formed in residuum and colluvium from

volcanic rocks with additions of loess and ash. The Zymans soils are on mountains, hills, plateaus and rock pediments. Slopes are 4 to 15 percent. The mean annual precipitation is about 10 inches and the mean annual temperature is about 47 degrees F.

Taxonomic class: Fine, montmorillonitic, mesic Aridic Argixerolls

Typical pedon: Zymans cobbly loam, in map unit 1285, rangeland. (Colors are for dry soil unless otherwise noted.)

A1--0 to 3 inches; dark brown (10YR 5/3) cobbly loam, brown (10YR 3/3) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine interstitial pores; 10 percent pebbles and 15 percent cobbles; slightly alkaline (pH 7.6); clear wavy boundary.

A2--3 to 8 inches; brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, sticky and plastic; many very fine, common fine and few medium roots; many very fine tubular pores; 5 percent pebbles, 5 percent cobbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt1--8 to 14 inches; grayish brown (10YR 5/2) clay, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; hard, very friable, very sticky and very plastic; many very fine and common fine and medium roots; many very fine tubular pores; common thin clay films on faces of peds and in pores; 10 percent pebbles; slightly alkaline (pH 7.6); clear wavy boundary.

Bt2--14 to 27 inches; yellowish brown (10YR 5/4) clay, dark brown (10YR 4/3) moist; strong fine and medium prismatic structure parting to strong fine and medium angular blocky; very hard, firm, very sticky and very plastic; common very fine and fine and few medium roots; common very fine tubular pores; many thin and common moderately thick dark yellowish brown (10YR 4/4) clay films, dark brown (10YR 3/3) moist on faces of peds and in pores; 10 percent pebbles; moderately alkaline (pH 7.8); clear wavy boundary.

Bt3--27 to 37 inches; light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; strong fine prismatic structure parting to strong fine and medium angular blocky; very hard, friable, very sticky and very plastic; common very fine and few fine and medium roots; few very fine tubular pores; many thin and common moderately thick dark yellowish brown (10YR 4/4) clay films, dark brown (10YR 3/3) moist on faces of peds and in pores; 5 percent pebbles; moderately alkaline (pH 8.0); clear wavy boundary.

Btk--37 to 48 inches; light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; moderate very fine and fine subangular blocky structure; very

hard, very friable, very sticky and plastic; few very fine and fine roots; few very fine tubular pores; common thin dark yellowish brown (10Y 4/4) clay films, dark brown (10YR 3/3) moist on faces of peds and in pores; common fine soft masses of lime; slightly effervescent; 10 percent pebbles; moderately alkaline (pH 8.4); abrupt wavy boundary.

Cr--48 to 52 inches; white (10YR 8/1) weathered volcanic tuff, light gray (2.5Y 7/2) moist; strong medium and thick platy rock structure; common fine soft masses of lime on faces of plates.

Type location: Washoe County, Nevada; about 2,500 feet east and 4,000 feet north of the southwest corner of section 27, T. 43 N., R. 18 E.; (41 degrees, 37 minutes, 22 seconds north latitude and 119 degrees, 57 minutes, 16 seconds west longitude.)

Range in Characteristics:

Soil moisture: Usually dry, moist in winter and spring, dry in summer and fall.

Soil temperature: 47 to 52 degrees F.

Mollic epipedon: 10 to 19 inches thick, includes the upper Bt horizon.

Depth to base of Bt horizon: 40 to 60 inches.

Depth to weathered bedrock: 40 to 60 inches.

Control section:

Clay content--45 to 60 percent, subhorizons in some pedons range from 35 to 60 percent.

Rock fragments--5 to 20 percent.

Other features--Clay increase is gradual, with less than 20 percent within 3 inches of the boundary of the A and Bt horizon.

A horizon:

Value--4 or 5 dry, 2 or 3 moist.

Chroma--2 or 3.

Reaction--Neutral or slightly alkaline.

Bt horizon:

Hue--10YR or 7.5YR.

Value--4 through 6 dry, 2 through 4 moist.

Chroma--2 through 6. (Low value and chroma are in the upper part of the horizon)

Structure--Prismatic or blocky.

Consistence--Hard to very hard, dry.

Texture--The textures of the upper part of the Bt horizon are clay and silty clay, the lower part of the Bt horizon textures are silty clay loam, clay loam and clay with 0 to 15 percent rock fragments and averages 5 to 20 percent rock fragments;

Reaction--Neutral to moderately alkaline, increasing with depth.

Lime accumulation--Segregated lime occurs below 35 inches in most pedons.

Formation of the Soils

This section relates various soils in the survey area to the major factors of soil formation.

Soil is a natural body on the surface of the earth, in which plants grow. It is a mixture of rock and mineral matter, organic matter, water, and air, which occur in varying proportions. The rocks and minerals are fragmented and partly or wholly weathered. Soils have distinctive layers, or horizons, that are the product of environmental forces acting upon materials deposited or accumulated by geological agencies. The layers are more distinct in some soils than others.

The characteristics of the soils at any given point are determined by the interaction of (1) the parent material; (2) the climate in which the parent material has accumulated and has existed since accumulation; (3) the relief or topography, which influences the local, or internal environment of the soil, its drainage, moisture content, aeration, susceptibility to erosion, and exposure to sun and wind; (4) the biological forces that act upon the soil material; and (5) the length of time that climate, relief, and biological factors have acted on the parent material.

Climate

The climate of Washoe County, Nevada, North Part generally is characterized by warm, dry summers and cool, moist winters. The average annual precipitation ranges from about 6 inches on the eastern edge of Surprise Valley to about 18 inches in some of the higher elevation areas. The average annual air temperature ranges from about 50 degrees in the basins to 40 degrees in some of the higher mountains. Major climatic variations are the result of the effect of topography and relief. As a consequence, the soils within the area reflect a general zonation with increasing elevation.

At the lowest elevations on the eastern edge of Surprise Valley the precipitation is about 6 to 8 inches. Weathering of parent materials is slow, leaching is incomplete, and eluviation and illuviation proceed at a minimal rate. The plant cover consists mostly of a sparse stand of drought and salt tolerant shrubs. Typical soils are low in organic matter and have a light colored, thin A horizon. Bighat, Isalde, and Raglan soils are examples of soils formed in the driest, warmer parts of the survey area.

As the elevation increases there is an accompanying increase in precipitation. This is reflected by deeper leaching of salts and carbonates, decreasing reaction, changes in kind and density of vegetation, and thickening and darkening in the color of the A horizon.

At high elevations where the precipitation is about 16 inches, leaching of salts and carbonates is more intensive, the soils are slightly acid to neutral, and the A horizon is thick and high in content of organic matter. Easte, Hackwood, and Newlands soils are examples of soils formed where the climate is cool and moist.

Freezing and thawing generally occur throughout the area. The effects of frost action are discernible by the heaving of plants and puddling of surface soil resulting from saturation during daytime thaw.

Living Organisms

Plants, animals, insects, and microorganisms are important biological forces that affect soil formation in the area. Plants appear to have the dominant effect.

On wet soils, the dense growth of sedges, grass, and other plants supply the organic matter that gives Welch and Wetvit soils a dark color.

Plants, because of climatic controls, reflect considerable variations in kind and amount as elevation increases. On basins, flood plains, alluvial fans, and terraces at low elevations, the plants are principally desert shrubs. Because of the scarcity of available moisture, plants cover only a small part of the surface. They add little organic matter to the soil, give little protection from wind and provide meager shade. Salt tolerant shrubs, which occur in this kind of plant community, also tend to recycle salts from deeper subsurface layers to the soil surface. Mazuma and Raglan soils are examples of soils formed under sparse vegetation.

Alluvial fans, terraces, and foothills of higher elevations have a plant cover of shrubs and grass, which is transitional from the desert shrub to the upland shrub and tree plant communities. The density of plants in these areas is somewhat greater, and the soils have accumulated more organic matter and have a darker colored A horizon. Langston and Saraph soils formed under transitional vegetation consisting mainly of sagebrush and grasses.

The plateaus and mountainous areas have denser stands of plants, which are dominated by shrubs, grasses, and trees. Because of the more abundant vegetation, the A horizon of the soils in these areas is dark colored, has subangular blocky soil structure and has increased considerably in thickness. Fiddler, Haggood, and Newlands soils formed under the vegetation common to mountains and high plateaus.

Relief

Relief, through its controls on drainage, runoff, and erosion, has had an important effect on soil formation in the area. Physiographic features of the area, which control relief to a considerable extent, include: (1) north-south oriented mountain ranges; (2) volcanic plateaus; and (3) enclosed valleys.

The mountain ranges are mainly characterized by excessive relief. Runoff is rapid to very rapid, and erosion occurs at a rapid rate. The removal of material by erosion interferes with soil profile development. Because of erosion, soil development is reflected primarily by dark A horizons. Bt horizons and Bw horizons occur in the more stable soils on these landscapes. Hartig, Hapgood, and Newlands soils are examples.

The volcanic plateaus have normal to subnormal relief. Runoff is slow to medium, and the removal of material by erosion is minimal. Because erosion is so slow, soil development has been able to proceed over a considerable period of time. The soils developed on these landscapes have a relatively thin A horizon and a clayey Bt horizon and are underlain by bedrock or duripan. Devada, Ferver, Halvert, Jaybee, Madeline, Ninemile, Nitpac, and Tinpan are examples of soils that have developed on plateaus.

The valleys are essentially basins that receive drainage from surrounding uplands. A typical valley is characterized by having a nearly flat playa or intermittent lake in its lowest part, which is bordered by lacustrine terraces, numerous longshore bars, embankments, and other shoreline features. Large fan piedmonts flank upland mountains and encroach on lower lying terraces, lake shorelines, and playas.

The terraces, fan piedmonts, and shoreline features have mostly normal relief. Erosion is essentially in equilibrium with the rate of soil development. Examples of soils that have formed on these landscapes include Orr and Surprise soils.

The low flat terraces and narrow flood plains have flat or concave relief. Runoff is very slow and the poor drainage in these soils has caused the formation of development of redoximorphic features. The soils in these areas support dense stands of meadow vegetation that has resulted in a dark colored A horizon because of the large additions of organic matter to the soil. Welch and Wetvit soils are examples of soils that have formed on these landscapes. Some soils that are subject to a high water table contain excessive soluble salts in their upper horizons. These soils are light colored and some have salt crusts on their surface. Examples of some of the soils developed on salt affected, flat, or concave surfaces are Dugway, Skullwak, and Updike series.

Parent Material

Parent material is the weathered rock or unconsolidated material from which soils form. The hardness, grain size, and porosity of the parent material and its content of weatherable minerals, greatly influence soil formation. The main sources of parent material in Washoe County,

Nevada, North Part are hard rock, weakly to strongly consolidated pyroclastic rocks, alluvium, and eolian sand. Hard rock sources of parent material principally include massive and jointed basalt, rhyolite, and andesite. These rocks contain considerable minerals that weather to form clays. Rhyolite contains considerable quartz and yields much quartz sand as a weathering product. The various kinds of hard rock in the area provide the parent material for a large part of the soils on mountains and plateaus. Generally, under comparable conditions, basalt, rhyolite, and andesite weather at a slower rate than other kinds of rock in the area.

Volcanic tuff, ash, breccia, obsidian, and agglomerate are interbedded with basalt, andesite, and rhyolite on the mountains and plateaus. Tuff also is interbedded with some of the older valley alluvium. Volcanic ash occurs in varying amounts in most of the parent materials within the survey area. The pyroclastic rocks have a mineralogical composition comparable to the various hard volcanic-flow rocks with which they are associated. They consequently weather to yield similar clays and other products of weathering. Because they are generally softer and more porous, the pyroclastic rocks are believed to weather more rapidly than the more massive hard rocks.

Alluvium, which is the parent material for the major area of soils in Long Valley and Mosquito Valley, consists of sandy, loamy, and clayey materials of mixed mineralogical composition that washed from surrounding uplands. These parent materials were deposited on alluvial fans, or narrow flood plains, and in lake basins. Alluvial deposits on fan piedmonts and flood plains are mostly loamy textured and contain varying amounts of gravel, cobble, and stones. Because of high porosity, particle-size characteristics, and a high content of weatherable minerals, these kinds of alluvial deposits have a potential for rapid weathering.

Alluvial deposits in lake basins consist mostly of silty and clayey material that contain varying amounts of salts. The Longdis and Updike soils are examples of soils formed in alluvium on the lake basins. Gravel and sand occur within the basins as longshore bars, lagoons, and other shoreline deposits. The Bighat, Langston, Fernpoint, Mazuma, Paypoint and Mcwatt soils are examples of soils formed in this kind of material. Weathering of the loamy materials can proceed rapidly under favorable conditions because of the high content of weatherable minerals and porosity. The clayey materials contain low amounts of weatherable minerals and have low permeability. Weathering is consequently slow and less obvious than in other parent materials in the area.

Eolian deposits and sandy beach deposits are in dune areas or beaches around the lake basin. These materials are sands of mixed mineralogical composition. They are porous and, under favorable conditions, have a potential for considerable alteration. The Davey, Mazuma, Isolde, and Zorravista soils are examples of soils on beaches or dunes.

Because of the general mineralogical similarity in parent materials of Washoe County, Nevada, North Part, soil formation under comparable climate, relief, and biological conditions tends toward the development of soils that have similar kinds and sequences of horizons. Notable exceptions are those soils that formed in clayey parent materials, and those soils that contain considerable amounts of volcanic ash and glass. High shrink-swell

action in clayey materials tends to restrict the development of subsurface horizons by causing mixing. Examples of these kinds of soils are the Boulder Lake, Karlo, Tunnison, and Weimer soils. Soils with considerable volcanic ash and glass are young enough that they usually show only some soil development. The Ashcamp, Ashdos, Ashone, Ashtre, Bitner, Boltz, Emagert, Frentera, Paypoint, Saraph, Tuffo, Tusune, Weezweed, Wetvit, and Yellowhills are examples of soils formed in material with considerable volcanic ash and glass. Other soils that contain ash and glass have weathered enough to produce silica. The weathering and the availability of silica in these materials tends to form horizons cemented by silica. The Buffaran, Chime, Esmod, Ferver, Grassycan, Halvert, Hangrock, Indian Creek, Lofftus, Nellspring, Nitpac and Powlow are examples of soils with horizons cemented by silica.

Time

The effect of time on soil formation in Washoe County, Nevada, North Part is readily apparent. The existence of flood plains, lacustrine terraces, sequences of alluvial fans and the stable volcanic plateaus indicate the relative age of soils formed on these landscapes.

The flood plains and presently aggrading alluvial fans are the most recent parent materials. Some recent parent materials that have been exposed to weathering by erosion are also in the steep mountains. Soils on these recent landforms have little or no profile development other than the formation of an A horizon with or without a Bw horizon. Wetvit soils on flood plains and Hapgood soils in upland areas are examples of soils that formed in recent parent material.

The intensity of soil development increases in sequence from recent to older landscapes. On lacustrine terraces

that are believed to date back to the close of the Pleistocene epoch and on alluvial fans and stable mountain areas of comparable age, the soils have developed an A horizon and a Bw or weak Bt horizon. Hartig, McConnel, Raglan, and Surprise soils are examples of soils that formed on landscapes of this age.

On landscapes that are believed to date back to late interpluvial periods of the Wisconsin stage, the soils have developed distinct A and Bt horizons and in some areas Bk or Bq horizons. The Bt horizon is strongly expressed and ranges in texture from clay loam to light clay. Major soil development in these soils probably took place prior to the Recent epoch. Hart Camp, Schamp, Uhaldi, and Zymans are examples of soils believed to date back to late in the Wisconsin age.

Older alluvial fans, terraces, and plateaus are believed to date back to the earlier part of the early Wisconsin stage of the Pleistocene epoch. Soils on these landscapes have an A horizon and a fine or very fine Bt horizon. Some soils on these landscapes have also developed indurated, silica cemented duripans. Stones and cobbles are only on the surface of some of these soils, possibly indicating frost activity during glacial periods of the Pleistocene epoch or a residual effect of longtime weathering and deepening of the soil profile. Soils that are believed to represent total effects of soil development over a period of time dating to the early Wisconsin age include Cotant, Esmod, Ferver, Madeline, Ninemile, Tinpan, and Toney soils.

Comparisons of soil profiles and the relative age of landscapes indicate that soils having distinct argillic (Bt) horizons may have developed their primary characteristics during the Wisconsin stage of the Pleistocene epoch. This indicates that soil development in Washoe County, Nevada, North Part has not been a rapid process.

Glossary

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alkali (sodic) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Alluvial cone. The material washed down the sides of mountains and hills by ephemeral streams and deposited at the mouth of gorges in the form of a moderately steep, conical mass descending equally in all directions from the point of issue.

Alluvial fan. The fanlike deposit of a stream where it issues from a narrow valley upon a plain, or of a tributary stream near or at its junction with its main stream.

Alluvial flat. A nearly level, graded, alluvial surface in bolsons and semi-bolsons. Commonly, an alluvial flat does not manifest terraces or floodplain levels.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipyridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Animal unit month (AUM). The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Area reclaim (in tables). An area difficult to reclaim after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Argillite. Weakly metamorphosed mudstone or shale.

Arroyo. The flat-floored channel of an ephemeral stream, commonly with very steep to vertical banks cut in alluvium.

Aspect. The direction in which a slope faces.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic

repeating pattern and defined and delineated as a single map unit.

Available water capacity (available moisture capacity).

The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 3.5
Low	3.5 to 5
Moderate	5 to 7.5
High	more than 7.5

Avalanche chute. The track or path formed by an avalanche.

Back slope. The geomorphic component that forms the steepest inclined surface and principal element of many hillsides. Back slopes in profile are commonly steep, are linear, and may or may not include cliff segments.

Backswamp. A floodplain landform of extensive, marshy, or swampy, depressed areas of flood plains between natural levees and valley sides or terraces.

Badland. Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels. Badland is most common in semiarid and arid regions where streams are entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

Ballena. A fan remnant having a distinctively-rounded surface of fan alluvium. The ballena's broadly rounded shoulders meet from either side to form a narrow summit and merge smoothly with concave, short pediments which form smoothly-rounded drainageways between adjacent ballenas. A partial ballena is a fan remnant large enough to retain some relict fan surface on a remnant summit.

Barrier beach. A wide gently sloping portion of a bolson floor comprising numerous, parallel, relict longshore-bars and lagoons built by a receding pluvial lake.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, K),

expressed as a percentage of the total cation-exchange capacity.

- Basin floor.** A general term for the nearly level, lower-most part of intermontane basins (i.e., bolson, semi-bolsos). The basin floor includes all of the alluvial, eolian, and erosional landforms below the piedmont slope.
- Beach terrace.** The relict shorelines from pluvial lakes, generally restricted to valley sides.
- Bedding planes.** Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.
- Bedding system.** A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.
- Bedrock.** The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.
- Bedrock-controlled topography.** A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.
- Bench terrace.** A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.
- Bisequum.** Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.
- Blowout.** A shallow depression from which all or most of the soil material has been removed by wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts, the water table is exposed.
- Board foot.** A unit of measure of the wood in lumber, logs, or trees. The amount of wood in a board one foot wide, one foot long, and one inch thick before finishing.
- Bolson.** A landscape term for an internally drained intermontane basin into which drainages from surrounding mountains converge inward toward a central depression.
- Boulders.** Rock fragments larger than 2 feet (60 centimeters) in diameter.
- Breaks.** The steep and very steep broken land at the border of an upland summit that is dissected by ravines.
- Breast height.** An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.
- Brush management.** Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.
- Butte.** An isolated small mountain or hill with steep or precipitous sides and a top variously flat, rounded, or pointed that may be a residual mass isolated by erosion or an exposed volcanic neck.

- Calcareous soil.** A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.
- Caldera.** A large, more or less circular depression, formed by explosion and/or collapse, which surrounds a volcanic vent or vents, and whose diameter is much greater than that of the included vent, or vents.
- Caliche.** A more or less cemented deposit of calcium carbonate in soils of warm-temperate, subhumid to arid areas. Caliche occurs as soft, thin layers in the soil or as hard, thick beds directly beneath the solum, or it is exposed at the surface by erosion.
- California bearing ratio (CBR).** The load-supporting capacity of a soil as compared to that of a standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be supported by standard crushed limestone, per unit area, with the same degree of distortion.
- Canopy.** The leafy crown of trees or shrubs. (See Crown.)
- Canyon.** A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.
- Capillary water.** Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.
- Catena.** A sequence, or "chain," of soils on a landscape that formed in similar kinds of parent material but have different characteristics as a result of differences in relief and drainage.
- Cation.** An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.
- Cation-exchange capacity.** The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.
- Channeled.** Refers to a drainage area in which natural meandering or repeated branching and convergence of a streambed have created deeply incised cuts, either active or abandoned, in alluvial material.
- Channery soil material.** Soil material that is, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a chanter.
- Chemical treatment.** Control of unwanted vegetation through the use of chemicals.
- Chiseling.** Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.
- Clay.** As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.
- Clay depletions.** Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the

removal of iron, manganese, and clay. A type of redoximorphic depletion.

Clayey soil. Silty clay, sandy clay, or clay.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Claypan. A slowly permeable soil horizon that contains much more clay than the horizons above it. A claypan is commonly hard when dry and plastic or stiff when wet.

Clearcut. A method of forest harvesting that removes the entire stand of trees in one cutting. Reproduction is achieved artificially or by natural seeding from adjacent stands.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Closed depression. A low area completely surrounded by higher ground and having no natural outlet.

Coarse fragments. Mineral or rock particles larger than 2 millimeters in diameter.

Coarse textured soil. Sand or loamy sand.

Cobble (or cobblestone). A rounded, partly rounded, or angular fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.

Cobbly soil material. Material that is 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material is 35 to 60 percent of these rock fragments, and extremely cobbly soil material is more than 60 percent.

Codominant trees. Trees whose crowns form the general level of the forest canopy and that receive full light from above but comparatively little from the sides.

Colluvium. Unconsolidated, unsorted earth material moved and deposited by mass movement on sideslopes and at the base of slopes.

Commercial forest. Forest land capable of producing 20 cubic feet or more per acre per year at the culmination of mean annual increment.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Compressible (in tables). Excessive decrease in volume of soft soil under load.

Concretions. Cemented bodies with crude internal symmetry organized around a point, a line, or a plane that typically takes the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.

Conglomerate. A coarse grained, clastic rock composed of rounded to subangular rock fragments more than 2 millimeters in diameter. It commonly has a matrix of

sand and finer textured material. Conglomerate is the consolidated equivalent of gravel.

Conservation cropping system. Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.

Conservation tillage. A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."

Contour strip cropping. Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but, for many, it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Coprogenous earth (sedimentary peat). Fecal material deposited in water by aquatic organisms.

Corrosion. Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Cover crop. A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.

Cropping system. Growing crops according to a planned system of rotation and management practices.

Crop residue management. Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.

Cross-slope farming. Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Cuesta. A hill or ridge that has a gentle slope on one side and a steep slope on the other; specifically, an asymmetric, homoclinal ridge capped by resistant rock layers of slight or moderate dip.

Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase.

- The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.
- Cutbanks cave** (in tables). The walls of excavations tend to cave in or slough.
- Decreasers**. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.
- Deep soil**. A soil that is 40 to 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.
- Deferred grazing**. Postponing grazing or resting grazing land for a prescribed period.
- Delta**. A body of alluvium having a surface that is nearly flat and fan shaped, deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.
- Dense layer** (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.
- Depth, soil**. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.
- Depth to rock** (in tables). Bedrock is too near the surface for the specified use.
- Desert pavement**. On a desert surface, a layer of gravel or larger fragments that was emplaced by upward movement of the underlying sediments or that remains after finer particles have been removed by running water or the wind.
- Dip slope**. A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedrock.
- Diversion (or diversion terrace)**. A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.
- Divided-slope farming**. A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.
- Dominant trees**. Trees whose crowns form the general level of the forest canopy and that receive full light from above and from the sides.
- Drainage class (natural)**. Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized: excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."
- Drainage, surface**. Runoff, or surface flow of water, from an area.
- Drainageway**. An area of ground at a lower elevation than the surrounding ground and in which water collects and is drained to a closed depression or lake or to a drainageway at a lower elevation. A drainageway may or may not have distinctly incised channels at its upper reaches or throughout its course.
- Duff**. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.
- Dune**. A mound, ridge, or hill of loose, windblown granular material (generally sand), either bare or covered with vegetation.
- Ecological Site**. A distinctive kind of rangeland or grazed forestland that has a unique historic potential native plant community. Ecological sites are the products of all the environmental factors that affect their development. An ecological site is capable of supporting a native plant community that has a unique kind and/or proportion of species or total vegetative production. Ecological sites in grazed forestland include both overstory and understory vegetation.
- Effervescence**. The quality of a soil measured when drops of diluted (1:10) hydrochloric acid (HCL) are added to the soil. The ratings are as follows:
- | | |
|----------------------------------|---------------------------------|
| Very slightly effervescent | few bubbles |
| Slightly effervescent | bubbles readily |
| Strongly effervescent | bubbles form low foam |
| Violently effervescent | bubbles form thick foam quickly |
- Eluviation**. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.
- Endosaturation**. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.
- Eolian soil material**. Earthy parent material accumulated through wind action; commonly refers to sandy material in dunes or to loess in blankets on the surface.
- Ephemeral stream**. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.
- Episaturation**. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.
- Erosion**. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.
- Erosion (geologic)**. Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.
- Erosion (accelerated)**. Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

- Erosion pavement.** A layer of gravel or stones that remains on the surface after fine particles are removed by sheet or rill erosion.
- Escarpment.** A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Synonym: scarp.
- Even aged.** Refers to a stand of trees in which only small differences in age occur between the individuals. A range of 20 years is allowed.
- Excess alkali** (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.
- Excess fines** (in tables). Excess silt and clay in the soil. The soil does not provide a source of gravel or sand for construction purposes.
- Excess lime** (in tables). Excess carbonates in the soil that restrict the growth of some plants.
- Excess salts** (in tables). Excess water-soluble salts in the soil that restrict the growth of most plants.
- Excess sodium** (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.
- Excess sulfur** (in tables). Excessive amount of sulfur in the soil. The sulfur causes extreme acidity if the soil is drained, and the growth of most plants is restricted.
- Extrusive rock.** Igneous rock derived from deep-seated molten matter (magma) emplaced on the earth's surface.
- Fallow.** Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.
- Fan apron.** A sheet-like mantle of relatively young alluvium covering part of an older fan piedmont surface. It somewhere buries a soil that can be traced to the edge of the fan apron.
- Fan piedmont.** The most extensive landform on piedmont slopes, formed by the coalescence of alluvial fans or accretions of fan aprons into one generally smooth slope.
- Fan remnant.** A general term for landforms that are remaining parts of older fan-landforms, that either have been dissected or partially buried.
- Fan skirt.** The zone of smooth, laterally-coalescing, small alluvial fans that issue from gullies cut into the fan piedmont or that are the coalescing extensions of inset fans of the fan piedmont, and that merge with the basin floor.
- Fast intake** (in tables). The rapid movement of water into the soil.
- Fertility, soil.** The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.
- Fibric soil material (peat).** The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.
- Field moisture capacity.** The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.
- Fill slope.** A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.
- Fine textured soil.** Sandy clay, silty clay, or clay.
- Firebreak.** An area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of fire fighters and equipment. Designated roads also serve as firebreaks.
- First bottom.** The normal flood plain of a stream, subject to frequent or occasional flooding.
- Flaggy soil material.** Material that is, by volume, 15 to 35 percent flagstones. Very flaggy soil material is 35 to 60 percent flagstones, and extremely flaggy soil material is more than 60 percent flagstones.
- Flagstone.** A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.
- Flood plain.** A nearly level alluvial plain that borders a stream and is subject to flooding unless protected artificially.
- Fluvial.** Of or pertaining to rivers; produced by river action, as a fluvial plain.
- Foothill.** A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.
- Foot slope.** The inclined surface at the base of a hill.
- Forb.** Any herbaceous plant not a grass or a sedge.
- Forest cover.** All trees and other woody plants (underbrush) covering the ground in a forest.
- Fragile** (in tables). A soil that is easily damaged by use or disturbance.
- Frost action** (in tables). Freezing and thawing of soil moisture. Frost action can damage roads, buildings and other structures, and plant roots.
- Genesis, soil.** The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.
- Gilgai.** The microrelief of clayey soils that shrink and swell considerably with changes in moisture content. Usually manifested as a succession of microbasins and microknolls in nearly level areas or of microvalleys and microridges parallel with the slope.
- Gleyed soil.** Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
- Graded strip cropping.** Growing crops in strips that grade toward a protected waterway.
- Grassed waterway.** A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.
- Gravel.** Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.
- Gravelly soil material.** Material that is 15 to 50 percent, by volume, rounded or angular rock fragments, not

prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

Green manure crop (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.

Ground water. Water filling all the unblocked pores of underlying material below the water table.

Gully. A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Gypsum. A mineral consisting of hydrous calcium sulfate.

Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

Heavy metal. Inorganic substances that are solid at ordinary temperatures and are not soluble in water. They form oxides and hydroxides that are basic. Examples are copper, iron, cadmium, zinc, manganese, lead, and arsenic.

Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

High-residue crops. Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.

Hill. A natural elevation of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and is dependent on local usage.

Holocene. The epoch of the Quaternary Period of geologic time, extending from the end of the Pleistocene Epoch (about 10 to 12 thousand years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. The major horizons of mineral soil are as follows:

O horizon.—An organic layer of fresh and decaying plant residue.

A horizon.—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.—Soft, consolidated bedrock beneath the soil.

R layer.—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasers commonly are the shorter plants and less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. A special case of the flood plain of an ephemeral stream that is confined between fan remnants, basin-floor remnants, ballenas, or closely opposed fan toeslopes.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermittent stream. A stream, or reach of a stream, that flows for prolonged periods only when it receives groundwater discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intermontane basin. A generic term for wide structural depressions between mountain ranges that are partly filled with alluvium. They may be drained internally (bolsons) or externally (semi-bolsons).

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:
Basin.--Water is applied rapidly to nearly level plains surrounded by levees or dikes.

Border.--Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes or borders.

Controlled flooding.--Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.--Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).--Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.--Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Sprinkler.--Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.--Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.--Water, released at high points, is allowed to flow onto an area without controlled distribution.

Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Lagoon. The nearly level, filled depression behind the longshore bar on a barrier beach.

Lake plain. A surface marking the floor of an extinct lake, filled in by well sorted, stratified sediments.

Lake terrace. The narrow shelf produced along a lake shore and later exposed when the water recedes.

Lamella. A thin, generally horizontal layer of fine material illuviated within a very much thicker, coarser, eluviated layer.

Landform. Any recognizable form or feature on the earth's surface, having a characteristic shape, and produced by natural causes that provide an empirical description of similar portions of the earth's surface.

Landscape. A collection of related, natural landforms.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Large stones (in tables). Rock fragments 3 inches (7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

Leaching. The removal of soluble material from soil or other material by percolating water.

Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy soil. Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, or silty clay loam.

Loess. Fine grained material, dominantly of silt-sized particles, deposited by wind.

Longshore bar. A narrow, elongate, coarse-textured ridge, built by the wave action of a pluvial lake, that extends parallel to the shore and separated it from a lagoon; both the bar and lagoon are now relict features.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

Low strength. The soil is not strong enough to support loads.

Marl. An earthy, unconsolidated deposit consisting chiefly of calcium carbonate mixed with clay in approximately equal amounts.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mean annual increment (MAI). The average annual increase in volume of a tree during the entire life of the tree.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Merchantable trees. Trees that are of sufficient size to be economically processed into wood products.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement. Nearly all such rocks are crystalline.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. A soil that is 20 to 40 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance—*few*, *common*, and *many*; size—*fine*, *medium*, and *coarse*; and contrast—*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse*, more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface, rising more than 1,000 feet above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range.

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

Mudstone. Sedimentary rock formed by induration of silt and clay in approximately equal amounts.

Munsell notation. A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Natric horizon. A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.

Neutral soil. A soil having a pH value between 6.6 and 7.3. (See Reaction, soil.)

Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and

manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Observed rooting depth. Depth to which roots have been observed to penetrate.

Organic matter. Plant and animal residue in the soil in various stages of decomposition.

Overstory. The trees in a forest that form the upper crown cover.

Oxbow. The horseshoe-shaped channel of a former meander, remaining after the stream formed a cutoff across a narrow meander neck.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan*, *fragipan*, *claypan*, *plowpan*, and *traffic pan*.

Parent material. The unconsolidated organic and mineral material in which soil forms.

Parna dune. An eolian dune built of sand size aggregates of clayey material that commonly occurs leeward of a playa.

Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pediment. A gently sloping erosional surface developed at the foot of a receding hill or mountain slope.

Pedisediment. A thin layer of alluvial material that mantles an erosion surface and has been transported to its present position from higher lying areas of the erosion surface.

Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Percolation. The downward movement of water through the soil.

Percs slowly (in tables). The slow movement of water through the soil adversely affects the specified use.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Extremely slow.....	0.00 to 0.01 inch
Very slow	0.01 to 0.06 inch
Slow	0.06 to 0.2 inch
Moderately slow	0.2 to 0.6 inch

Moderate	0.6 inch to 2.0 inches
Moderately rapid	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

Piedmont slope. The dominant slope at the foot of a mountain. Main components of the piedmont slope include pediments, alluvial fans, fan piedmonts, fan skirts and inset fans.

Piping (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.

Pitting (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.

Plasticity index. The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plateau. An extensive upland mass with relatively flat summit area that is considerably elevated (more than 100 meters) above adjacent lowlands and separated from them on one or more sides by escarpments.

Playa. The generally dry and nearly level lake plain that occupies the lowest parts of closed depressional areas, such as those on intermontane basin floors. Temporary flooding occurs primarily in response to precipitation and runoff.

Pleistocene. The epoch of the Quaternary Period of geologic time preceding the Holocene (from approximately 2 million to 10 thousand years ago).

Plowpan. A compacted layer formed in the soil directly below the plowed layer.

Pluvial. Relating to former periods of abundant rains.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poor filter (in tables). Because of rapid or very rapid permeability, the soil may not adequately filter effluent from a waste disposal system.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Poor outlets (in tables). Refers to areas where surface or subsurface drainage outlets are difficult or expensive to install.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Quartzite, metamorphic. Rock consisting mainly of quartz that formed through recrystallization of quartz-rich sandstone or chert.

Quaternary. The period of geologic time, extending from about 2 million years ago to the present and comprising two epochs, the Pleistocene (Ice Age) and Holocene (Recent).

Quartzite, sedimentary. Very hard but unmetamorphosed sandstone consisting chiefly of quartz grains.

Range condition. The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community has departed from the potential.

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Range site. An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind or proportion of species or total production.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline (mildly alkaline)	7.4 to 7.8
Moderately alkaline	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of

iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regeneration. The new growth of a natural plant community, developing from seed.

Regolith. The unconsolidated mantle of weathered rock and soil material on the earth's surface; the loose earth material above the solid rock.

Relict stream terrace. One of a series of platforms in or adjacent to a stream valley that formed prior to the current stream system.

Relief. The elevations or inequalities of a land surface, considered collectively.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rill. A steep-sided channel resulting from accelerated erosion. A rill is generally a few inches deep and not wide enough to be an obstacle to farm machinery.

Riverwash. Unstable areas of sandy, silty, clayey, or gravelly sediments. These areas are flooded, washed, and reworked by rivers so frequently that they support little or no vegetation.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bare bedrock other than lava flows and rock-lined pits.

Rooting depth (in tables). Shallow root zone. The soil is shallow over a layer that greatly restricts roots.

Root zone. The part of the soil that can be penetrated by plant roots.

Rubble land. Areas that have more than 90 percent of the surface covered by stones or boulders. Voids contain no soil material and virtually no vegetation other than lichens. The areas commonly are at the base of mountain slopes, but some are on mountain slopes as deposits of cobbles, stones, and boulders left by Pleistocene glaciation or by periglacial phenomena.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium.

Salinity. The electrical conductivity of a saline soil. It is expressed, in millimhos per centimeter, as follows:

Nonsaline	0 to 2
Very slightly saline	2 to 4
Slightly saline	4 to 8
Moderately saline	8 to 16
Strongly saline	More than 16

Salty water (in tables). Water that is too salty for consumption by livestock.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sand sheet. A large, irregularly shaped, surficial mantle of eolian sand.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy soil. Sand or loamy sand.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Unconsolidated residual material underlying the soil and grading to hard bedrock below.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Sawlogs. Logs of suitable size and quality for the production of lumber.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Scribner's log rule. A method of estimating the number of board feet that can be cut from a log of a given diameter and length.

Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.

Sedimentary rock. Rock made up of particles deposited from suspension in water. The chief kinds of sedimentary rock are conglomerate, formed from gravel; sandstone, formed from sand; shale, formed from clay; and limestone, formed from soft masses of calcium carbonate. There are many intermediate types. Some wind-deposited sand is consolidated into sandstone.

Seepage (in tables). The movement of water through the soil. Seepage adversely affects the specified use.

Semi-bolson. An intermontane basin that is drained externally by an intermittent stream.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock formed by the hardening of a clay deposit.

Shallow soil. A soil that is 10 to 20 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shelterwood system. A forest management system requiring the removal of a stand in a series of cuts so that regeneration occurs under a partial canopy. After regeneration, a final cut removes the shelterwood and allows the stand to develop in the open as an even-aged stand. The system is well suited to sites where shelter is needed for regeneration, and it can aid regeneration of the more intolerant tree species in a stand.

Shoulder slope. The uppermost inclined surface at the top of a hillside. It is the transition zone from the back slope to the summit of a hill or mountain. The surface is dominantly convex in profile and erosional in origin.

Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

Shrub-coppice dune. A small dune that forms around shrubs or small trees.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Sinkhole. A depression in the landscape where limestone has been dissolved.

Site class. A grouping of site indexes into five to seven production capability levels. Each level can be represented by a site curve.

Site curve (50-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for the range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 50 years old or are 50 years old at breast height.

Site curve (100-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for a range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 100 years old or are 100 years old at breast height.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in

a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Skid trails. Pathways along which logs are dragged to a common site for loading onto a logging truck.

Slash. The branches, bark, treetops, reject logs, and broken or uprooted trees left on the ground after logging.

Slickens. Accumulations of fine-textured material, such as material separated in placer-mine and ore-mill operations. Slickens from ore mills commonly consist of freshly ground rock that has undergone chemical treatment during the milling process.

Slickensides. Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.

Slick spot. A small area of soil having a puddled, crusted, or smooth surface and an excess of exchangeable sodium. The soil generally is silty or clayey, is slippery when wet, and is low in productivity.

Slippage (in tables). Soil mass susceptible to movement downslope when loaded, excavated, or wet.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, the following slope classes are recognized:

Nearly level	0 to 2 percent
Gently sloping	2 to 4 percent
Moderately sloping	4 to 8 percent
Strongly sloping	8 to 15 percent
Moderately steep	15 to 30 percent
Steep	30 to 50 percent
Very steep	50 to 75 percent
Extremely steep	75 percent and higher

Slope (in tables). Slope is great enough that special practices are required to ensure satisfactory performance of the soil for a specific use.

Slow intake (in tables). The slow movement of water into the soil.

Slow refill (in tables). The slow filling of ponds, resulting from restricted permeability in the soil.

Small stones (in tables). Rock fragments less than 3 inches (7.6 centimeters) in diameter. Small stones adversely affect the specified use of the soil.

Sodic (alkali) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Sodicity. The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of Na^+ to $Ca^{++} + Mg^{++}$. The degrees of sodicity and their respective ratios are:

Very slight	5-12:1
Slight	13-30:1
Moderate	31-45:1

Strong	46-90:1
Very strong	more than 90:1

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Species. A single, distinct kind of plant or animal having certain distinguishing characteristics.

Stone line. A concentration of coarse fragments in a soil. Generally, it is indicative of an old weathered surface. In a cross section, the line may be one fragment or more thick. It generally overlies material that weathered in place and is overlain by recent sediment of variable thickness.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Strath terrace. A surface cut formed by the erosion of hard or semiconsolidated bedrock and thinly mantled with stream deposits.

Stream channel. The hollow bed where a natural stream of surface water flows or may flow; the deepest or central part of the bed, formed by the main current and covered more or less continuously by water.

Stream terrace. One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel. It originally formed near the level of the stream and is the dissected remnants of an abandoned flood plain, streambed, or valley floor that were produced during a former stage of erosion or deposition.

Stripcropping. Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to soil blowing and water erosion.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are: *platy* (laminated), *prismatic*

(vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grain* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

Summit. A general term for the top, or highest level, of an upland feature, such as a hill or mountain. It commonly refers to a higher area that has a gentle slope and is flanked by steeper slopes.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer" or the "Ap horizon."

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

Tailwater. The water directly downstream of a structure.

Talus. Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Terrace. An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field is generally built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). A step-like surface, ordinarily flat or undulating, bordering a river, a lake, or the sea representing a former flood plain.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand*, *loamy sand*, *sandy loam*, *loam*,

The principal forms of soil structure are: *platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grain* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

Summit. A general term for the top, or highest level, of an upland feature, such as a hill or mountain. It commonly refers to a higher area that has a gentle slope and is flanked by steeper slopes.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer" or the "Ap horizon."

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

Tailwater. The water directly downstream of a structure.

Talus. Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Terrace. An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field is generally built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). A step-like surface, ordinarily flat or undulating, bordering a river, a lake, or the sea representing a former flood plain.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand*, *loamy sand*, *sandy loam*, *loam*, *silt loam*, *silt*, *sandy clay loam*, *clay loam*, *silty clay loam*, *sandy clay*, *silty clay*, and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

Thin layer (in tables). Otherwise suitable soil material too thin for the specified use.

Till plain. An extensive area of nearly level to undulating soils underlain by glacial till.

Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toe slope. The outermost inclined surface at the base of a hill; part of a foot slope.

Too arid (in tables). The soil is dry most of the time, and vegetation is difficult to establish.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Toxicity (in tables). Excessive amount of toxic substances, such as sodium or sulfur, that severely hinder establishment of vegetation or severely restrict plant growth.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Trafficability. The degree to which a soil is capable of supporting vehicular traffic across a wide range in soil moisture conditions.

Tread. The relatively flat terrace surface that was cut or built by stream or wave action.

Tuff. A compacted deposit that is 50 percent or more volcanic ash and dust.

Understory. Any plants in a forest community that grow to a height of less than 5 feet.

Unstable fill (in tables). Risk of caving or sloughing on banks of fill material.

Upland (geology). Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.

Valley. An elongated depressional area primarily developed by stream action.

Valley fill. In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.

Variation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Very deep soil. A soil that is more than 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Very shallow soil. A soil that is less than 10 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Soil Survey of Washoe County, Nevada, North Part

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and woodland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; and for wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Interpretative ratings help engineers, planners, and others to understand how soil properties influence important nonagricultural uses, such as building site development and construction materials. The ratings indicate the most

restrictive soil features affecting the suitability of the soils for these uses.

Soils are rated in their natural state. No unusual modification of the soil site or material is made other than that which is considered normal practice for the rated use. Even though soils may have limitations, it is important to remember that engineers and others can modify soil features or can design or adjust the plans for a structure to compensate for most of the limitations. Many of these practices, however, are costly. The final decision in selecting a site for a particular use generally involves weighing the costs of site preparation and maintenance.

Planners and others using soil survey information can evaluate the effect of specific uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, trees, and shrubs.

Crops and Pasture

General management needed for crops and pasture is suggested in this section. The system of land capability classification used by the Natural Resources Conservation Service is explained. The estimated yields of the main crops and pasture plants are listed for each soil in table 6 at the back of this publication.

Planners of management systems for individual fields or farms should consider the detailed information given in the description of each soil under the heading "Detailed Soil Map Units" in Part I of this Publication and in the "Soil Properties" portion of Part II. Specific information can be obtained from the local office of the Natural Resources Conservation Service or Nevada Cooperative Extension.

Cropland Limitations and Hazards

The management concerns affecting the use of the detailed soil map units in this survey area are shown in table 5, "Main Cropland Limitations and Hazards." The main concerns in managing irrigated cropland are efficient water use, control of soil blowing and water erosion, maintenance of soil fertility, pest and weed control, and timely planting and harvesting.

Efficient water use consists primarily of optimizing the water intake rate and reducing the runoff and evaporation rates. An irrigation system that provides optimum control and distribution of water is essential. Excessive irrigation wastes water, causes erosion, leaches plant nutrients, and increases the potential for ground-water pollution. It also can create drainage problems, raise the water table, and increase soil salinity. Applying conservation tillage and conservation crop rotation, farming on the contour, stripcropping, establishing field windbreaks, and leaving crop residue on the surface conserve moisture.

Generally, a combination of several practices is needed to control *soil blowing* and *water erosion*. Conservation crop rotation, stripcropping, field windbreaks, tall grass barriers, contour farming, residue management, diversions, and grassed waterways help to prevent excessive soil loss.

Measures that are effective in maintaining *soil fertility* include applying fertilizer, both organic and inorganic, including manure; incorporating crop residue or green manure crops into the soil; and using proper crop rotations. Controlling erosion helps to prevent the loss of organic matter and plant nutrients and thus helps to maintain productivity, although the level of fertility can be reduced even in areas where erosion is controlled. All soils used for irrigated crops respond well to applications of fertilizer.

Some of the limitations and hazards shown in the table cannot be easily overcome. These are *channels*, *flooding*, *depth to rock*, *ponding*, and *gullies*.

Additional limitations and hazards are as follows:

Excessive permeability.--This limitation allows deep leaching of nutrients and pesticides. The capacity of the soil to retain moisture for plant use is poor.

Potential for ground-water pollution.--This is a hazard in soils with excessive permeability, hard bedrock, or a water table within the profile.

Lime content, *poor tilth*, *restricted permeability*, and *surface crusting*.--These limitations can be overcome by incorporating green manure crops, manure, or crop residue into the soil; applying a system of conservation tillage; and using conservation cropping systems. Also, crops may respond well to additions of phosphate fertilizer to soils that have a high content of lime. Applications of sulfur may be useful in minimizing crusting.

Short frost-free season.--If the growing season is less than 90 days, short-season crops or grasses should be grown.

Surface rock fragments.--This limitation causes rapid wear of tillage equipment. It cannot be easily overcome.

Slope.--Where the slope is more than 8 percent, water erosion may be accelerated unless conservation farming practices are applied.

Surface stones.--Stones or boulders on the surface can hinder normal tillage unless they are removed.

Salt and sodium content.--In areas where this is a limitation, only salt- and sodium-tolerant crops should be grown.

Following is an explanation of the criteria used to determine the limitations or hazards.

Channeled.--The word "channeled" is included in the name of the map unit.

Depth to rock.--Bedrock is within a depth of 40 inches.

Erosion by water.--The surface K factor multiplied by the upper slope limit is more than 2 (same as prime farmland criteria).

Excessive permeability.--The upper limit of the permeability range is more than 6 inches per hour within the soil profile.

Flooding.--The component of the map unit is occasionally flooded or frequently flooded.

Gullied.--The word "gullied" is included in the name of the map unit.

Lime content.--The component is assigned to wind erodibility group 4L or has more than 5 percent lime in the upper 10 inches.

Limited available water capacity.--The available water capacity calculated to a depth of 60 inches or to a root-limiting layer is 4.5 inches or less.

Ponding.--Ponding duration is assigned to the component of the map unit.

Potential for ground-water pollution.--The soil has a water table within a depth of 4 feet or hard bedrock within the profile, or permeability is more than 6 inches per hour within the soil.

Poor tilth.--The component of the map unit has more than 35 percent clay in the surface layer.

Restricted permeability.--Permeability is 0.06 inch per hour or less within the soil profile.

Salt content.--The component of the map unit has an electrical conductivity of more than 4 in the surface layer or more than 8 within a depth of 30 inches.

Short frost-free season.--The component of the map unit has a growing season of less than 90 frost-free days.

Slope.--The upper slope range of the component of the map unit is more than 8 percent.

Sodium content.--The sodium adsorption ratio of the component of the map unit is more than 13 within a depth of 30 inches.

Soil blowing.--The wind erodibility index multiplied by the selected C factor and then divided by the T factor is equal to or more than 8 for the component of the map unit.

Surface rock fragments.--The terms describing the texture of the surface layer include any rock fragment modifier except for gravelly or channery, and "surface stones" is not already indicated as a limitation.

Surface crusting.--The sodium adsorption ratio in the surface layer is 5 or more for any texture and 4 or more if the texture is silt, silt loam, loam, or very fine sandy loam.

Surface stones.--The terms describing the texture of the surface layer include any stony or bouldery modifier, or the soil is a stony or bouldery phase.

Water table.--The component of the map unit has a water table within a depth of 60 inches.

Crop Yield Estimates

The average yields per acre that can be expected of the principal irrigated crops under a high level of management are shown in table 6, "Land Capability and Yields per Acre of Crops." In any given year, yields may be higher or lower than those indicated in the table because of variations in rainfall and other climatic factors. The land capability classification of each map unit also is shown in the table.

The yields are based mainly on the experience and records of farmers, conservationists, and extension agents. Available yield data from nearby counties and results of field trials and demonstrations are also considered.

For yields of irrigated crops, it is assumed that the irrigation system is adapted to the soils and to the crops grown, that good-quality irrigation water is uniformly applied as needed, and that tillage is kept to a minimum.

The management needed to obtain the indicated yields of the various crops depends on the kind of soil and the crop. Management can include drainage, erosion control, and protection from flooding; the proper planting and seeding rates; suitable high-yielding crop varieties; appropriate and timely tillage; control of weeds, plant diseases, and harmful insects; favorable soil reaction and optimum levels of nitrogen, phosphorus, potassium, and trace elements for each crop; effective use of crop residue, barnyard

manure, and green manure crops; and harvesting that ensures the smallest possible loss.

The estimated yields reflect the productive capacity of each soil for each of the principal crops. Yields are likely to increase as new production technology is developed. The productivity of a given soil compared with that of other soils, however, is not likely to change.

Crops other than those shown in the table are grown in the survey area, but estimated yields are not listed because the acreage of such crops is small. The local office of the Natural Resources Conservation Service or Cooperative Extension can provide information about the management and productivity of the soils for those crops.

Pasture and Hayland Interpretations

Under good management, proper grazing is essential for the production of high quality forage, stand survival, and erosion control. Proper grazing helps plants to maintain sufficient and generally vigorous top growth during the growing season. Brush control is essential in many areas, and weed control generally is needed. Rotation grazing and renovation also are important management practices.

Yield estimates are often provided in animal unit months (AUM), the amount of forage or feed required to feed one animal unit (one cow, one horse, one mule, five sheep, or five goats) for 30 days.

Information about forage yields other than those shown in the table "Land Capability and Yields per Acre of Crops" can be provided by the local office of the Natural Resources Conservation Service or Cooperative Extension.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for woodland, or for engineering purposes.

In the capability system, as described in "Land Capability Classification" (6), soils generally are grouped at three levels: capability class, subclass, and unit. These levels indicate the degree and kinds of limitations affecting mechanized farming systems that produce the more commonly grown field crops, such as corn, small grain, cotton, hay, and field-grown vegetables. Only class and subclass are used in this survey.

Capability classes, the broadest groups, are designated by Roman numerals I through VIII. The numerals indicate progressively greater limitations and narrower choices for practical use.

If properly managed, soils in classes I, II, III, and IV are suitable for the mechanized production of commonly grown field crops and for pasture and woodland. The degree of the soil limitations affecting the production of cultivated crops increases progressively from class I to class IV. The limitations can affect levels of production and the risk of permanent soil deterioration caused by erosion and other factors.

Soils in classes V, VI, and VII are generally not suited to the mechanized production of commonly grown field crops without special management, but they are suitable for plants that provide a permanent cover, such as grasses and trees. The severity of the soil limitations affecting crops increases progressively from class V to class VII. The local office of the Cooperative Extension or Natural Resources Conservation Service can provide guidance on the use of these soils as cropland.

Areas in class VIII are generally not suitable for crops, pasture, or woodland without a level of management that is impractical. These areas may have potential for other uses, such as recreational facilities and wildlife habitat.

Capability subclasses indicate the dominant limitations in the class. They are designated by adding a small letter, e, w, s, or c, to the class numeral, for example, IIe. The letter e shows that the main hazard is the risk of erosion unless a close-growing plant cover is maintained; w shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); s shows that the soil is limited mainly because it is shallow, droughty, or stony; and c shows that the chief limitation is a climate that is very cold or very dry.

There are no subclasses in class I because the soils of this class have few limitations. Class V contains only the subclasses indicated by w, s, or c because the soils in class V are subject to little or no erosion. They have other limitations that restrict their use mainly to pasture, rangeland, woodland, wildlife habitat, or recreation.

The irrigated capability classification of each farmland map unit is given in table 6, "Land Capability and Yields per Acre of Crops."

Erosion Factors

Soil erodibility factors Kw and Kf quantify the susceptibility of soil to detachment by water. A wind erodibility group (WEG) is a grouping of soils that have similar properties affecting their resistance to soil blowing. The Wind Erodibility Index (I) is based on the WEG and is used in the wind erosion equation. Soil erodibility factors Kw and Kf are used in the Revised Universal Soil Loss Equation. The procedure for predicting soil loss is useful in

guiding the selection of soil and water conservation practices.

Soil Erodibility Factors Kw and Kf

Factor Kw shows the erodibility of the whole soil, and factor Kf shows the erodibility of only the fine-earth fraction, the material less than 2.0 millimeters in diameter. The soil erodibility factor indicates the susceptibility of a soil to sheet and rill erosion by water. The soil properties that influence erodibility are those that affect the infiltration rate, the movement of water through the soil, and the water storage capacity of the soil and those that allow the soil to resist dispersion, splashing, abrasion, and the transporting forces of rainfall and runoff. The most important soil properties are the content of silt plus very fine sand, the content of sand coarser than very fine sand, the content of organic matter, soil structure, and permeability.

Wind Erodibility Groups

Soils are assigned wind erodibility groups on the basis of the properties of the surface layer. The properties that are most important with respect to soil blowing are soil texture, content of organic matter, calcium carbonate, reaction, content of rock fragments, and aggregate stability. Wind erodibility is inversely related to the percentage of dry surface soil aggregates larger than 0.84 millimeter in diameter. From this percentage, the wind erodibility index factor (I) is determined.

Soil Loss Tolerance (T) Factor

The annual Soil Loss Tolerance (T) is an estimate of the maximum rate of erosion that can occur without affecting crop productivity. The T factor is expressed in tons of soil loss per acre per year. Values of 1 to 5 are used. T values are assigned according to properties of limiting subsurface soil layers. The designation of a limiting layer implies that the material above the layer has more favorable properties for crop production. The criteria for assigning T are based on the severity of physical or chemical properties of subsurface layers, the climatically influenced properties of soil moisture and temperature, the economic feasibility of utilizing management practices to overcome limiting layers or conditions, and the depth to the limiting layer.

Additional information about wind erodibility groups and I, Kw, Kf, and T factors can be obtained from local offices of the Natural Resources Conservation Service or Cooperative Extension.

Rangeland And Grazeable Woodland Resource Management

In this soil survey report, the term "rangeland" refers to a kind of land rather than a land use. Areas of rangeland provide many important resource values. They act as vast watersheds and provide habitat for wildlife, livestock forage, and opportunities for recreation. The resource values of rangeland are intricately related to each other and are often directly affected by rangeland management. Because of the interrelationships among rangeland resources, rangeland managers should consider all resource values when planning range improvements.

About 90 percent of the acreage in this survey area is rangeland. Livestock grazing is the principal agricultural use of the rangeland. Livestock operations are mostly cow-calf or cow-calf-sheep enterprises. Ranches range from a few hundred to several thousands acres in size. They rely heavily on permitted use of public lands. Most of the rangeland within the survey area is administered by the Bureau of Land Management. The Bureau of Indian Affairs has management responsibility for the rangeland within Indian reservations.

Soil-Site Correlation

During the course of this soil survey, ecological sites were correlated with the soils identified within the survey area. These correlations are based on the current understanding of soil-plant-climate relationships in the survey area. Soil properties that affect moisture supply and plant nutrients have the greatest influence on the productivity of range plants. Soil reaction, content of salts or lime, and topographic position are also important. The relationship of climate to vegetation and soils is considered in the classification of soils and in soil mapping criteria. In areas that have similar climate and topography, differences in the kind and amount of vegetation produced on rangeland are closely related to the kind of soil. Ecological sites can generally be determined from soil maps and map unit legends developed for the survey area.

Range Condition

The early devastation of rangeland plant communities through uncontrolled livestock grazing ended long ago, but severely depleted areas still reflect the abuses of early settlement. In the most severely disturbed areas, palatable shrubs generally have been replaced by less desirable shrubs and many native perennial grasses and forbs have been replaced by alien or introduced annual grasses and forbs. Recovery of the plant community has been most

evident where previous abuses were limited. The greater the level of deterioration, the longer the period of recovery. Although present-day rangeland production and plant diversity in the survey area are generally less than optimal, the overall condition of the rangeland is much improved from what was common in the early 1900's.

Range condition is determined by a comparison of the present plant community with the natural potential plant community on a particular rangeland ecological site. The more closely the existing community resembles the potential plant community, the higher the range condition. Range condition is an ecological rating only. It does not have a specific meaning that pertains to the present plant community for a given use. Ratings of range condition alone do not indicate whether the present plant community is improving or deteriorating in relation to its potential. The trend in range condition is a measure of the direction of change in the condition. It is an expression of the effects of current use. The present range condition is a reflection of the accumulated effects of past use. Once the potential plant communities have been identified and the present range condition has been determined, monitoring the trend in range condition over time can indicate whether management objectives are being met.

Rangeland Management

Range management requires a knowledge of the kinds of soil and of the natural potential plant communities the soils in a given area can support. It also requires an evaluation of the present range condition. For most rangeland plant communities, good management can improve the present condition and productivity of the range and can help to prevent accelerated erosion. Proper management of rangeland depends on many factors. The season of grazing use, the kind of grazing animal, the intensity and distribution of grazing, and the range resource potential are important management considerations. Multiple-use management that meets present and future needs requires extensive knowledge of the capabilities and limitations of the range resources. An understanding of the soil properties and dynamics of native plant communities is fundamental in applying ecological principles to the evaluation and management of rangeland.

Generally, the objective of range management is to manage grazing so that the plants growing on a site are about the same in kind and amount as the natural potential plant community for that site. Such management generally results in the optimum production of vegetation, conservation of water, and control of erosion. To meet a special need or a specific use, however, it may be

desirable to manage for a plant community other than the potential plant community for the site. Care must always be taken not to increase the susceptibility to erosion. Future uses and the relative ability of given sites to respond to management should be considered if the management objective is to establish a plant community other than the potential plant community.

Desirable forage plants of many plant communities within the survey area have been greatly depleted or even eliminated by excessive and untimely grazing. Generally, perennial grasses have decreased in abundance and woody plants have increased. The productivity of forage plants is below the production potential on many sites. Uneven livestock distribution has resulted in both overuse and underuse of the native forage.

An increase in the abundance and size of shrubs and an extensive invasion of cheatgrass (an introduced annual grass) have reduced the amount of soil moisture and nutrients available to perennial grasses and forbs. In areas where the range condition has not excessively deteriorated and an adequate population of desirable perennial grasses and forbs is available to respond to a release from plant competition, brush management can be effective in reversing the trend toward an increasing dominance of woody vegetation.

Abusive grazing of riparian vegetation by livestock can reduce water quality, eliminate streamside shrubs, cause soil compaction, accelerate erosion, and break down streambanks. Proper management of the rangeland in the survey area requires that special attention be given to riparian zones. Fortunately, riparian communities often respond to improved livestock management more rapidly than upland plant communities. Grazing treatments in riparian areas vary with the stability of the riparian plant community and the condition of the adjacent upland plant communities.

Rangeland Seeding

Rangeland seeding may be required following the removal of woody vegetation in areas where desirable understory plants are scarce or are not included in the present plant community. Revegetation also may be necessary for critical area treatment following a wildfire or other major disturbance. Maximum grazing capacity can be achieved in seeded stands where the objective of management is uniform grazing of the stands and prevention of the concentration of livestock. Additional water developments and fencing may be required to meet management objectives.

The success of range seeding depends on the amount of moisture available during the growing season. Even in areas where adapted species are planted and improved seeding and land treatment techniques are applied, the success of range seeding is strongly influenced by rainfall. The distribution and amount of precipitation in the survey area fluctuate widely from one year to the next. Years of below normal precipitation are relatively frequent, and the risk of seeding failure caused by the unpredictability of climate should be acknowledged in addition to critical soil properties that affect seeding success.

Each soil in the survey area is rated in the table "Suitability for Rangeland Seeding." The criteria used in the development of these ratings are available from the

local Nevada office of the Natural Resources Conservation Service. Where critical area treatment is necessary, providing a plant cover that helps to prevent accelerated erosion may be advantageous on soils that are poorly suited to range seeding. The plants that are suited to the soils in the area to be treated should be selected for seeding.

More specific management concerns are addressed under the heading "Plant Communities in Washoe County, Nevada, North Part" later in this section. Additional information about rangeland management can be obtained from local offices of the Natural Resources Conservation Service or Cooperative Extension.

Wildlife Considerations

Reducing the extent of brush cover can benefit many game and nongame wildlife species where the habitat needs of those animals are properly identified and planned for in the manipulation of vegetation. For instance, extensive areas dominated by big sagebrush provide marginal habitat for pronghorn antelope. The habitat can be improved by measures that decrease the density and height of the sagebrush. The habitat for mule deer can be improved by removing big sagebrush and thus enhancing the diversity of understory grasses and forbs or increasing the production of green forage on transitional range that has an excessive cover of shrubs.

For other species, however, brush removal may be detrimental. Sage grouse is a habitat-specific bird, relying primarily on sagebrush to meet its life requirements. Plans for the manipulation of sagebrush stands on range inhabited by sage grouse should provide for the maintenance of suitable grouse habitat, especially nesting habitat near strutting grounds. The optimum nesting habitat for sage grouse is one in which the crown cover of sagebrush that is less than 30 inches high is 20 to 40 percent. Treatment of the sagebrush that reduces the cover from 40 to 20 percent may not seriously degrade the nesting habitat and commonly improves the quality of forage for sage grouse.

In an assessment of how the manipulation of vegetation affects wildlife, "edge" habitat is an important consideration. The structure and dominance of plants that remain after manipulation differ with the method of treatment. Fire removes all of the vegetation, including the skeletons or woody portions of shrubs, and thus eliminates the structure of woody vegetation from the treated area. Prescribed burning may enhance the habitat for a number of wildlife species. Mule deer and many nongame species select recently burned areas for feeding. Brush treatment with herbicides leaves the dead skeletons of shrubs and retains the shrub structure. Herbicides may kill broad-leaved forbs in the shrub understory, which are staples in the diet of many game and nongame species. Chaining and, to a lesser degree, brush beating change the vegetative structure from tree/shrub or shrub to grassland, and the residue they leave on the ground creates habitat for small mammals.

Many wildlife species in the survey area depend on riparian plant communities during much of the year. These plant communities support wildlife not common to desert ecosystems, such as short-eared owls, Pacific tree frogs, and long-tailed weasels. Riparian communities also

provide islands of habitat in desert environments for migrating birds, Nuthatches, warblers, and other species that nest in forest ecosystems migrate to desert riparian zones in spring and fall.

Livestock water developments can be beneficial to wildlife if the water is available when the wildlife species occupy the area. Forage for wildlife can be enhanced if adapted forbs are included in a rangeland seeding.

More specific wildlife management concerns are addressed under the heading "Plant Communities in Washoe County, Nevada, North Part." Additional information about wildlife management can be obtained from local offices of the Natural Resources Conservation Service, Nevada Cooperative Extension, or Nevada Division of Wildlife.

Plant Communities in Washoe County, Nevada, North Part

A rangeland ecological site is a distinctive kind of rangeland that differs from other kinds of rangeland in its ability to produce a characteristic natural plant community. An ecological site is the product of all environmental factors responsible for its development. It can support a native plant community typified by an association of species that differs from the potential plant community of other ecological sites in the kind or proportion of species or in total production. Disturbances, such as drought, fire, and grazing by native fauna, and the damage caused by insects and disease are recognized as natural factors in the development of native plant communities.

The appendix in the section "Rangeland Plants and Woodland Understory" shows the rangeland plants and woodland understory for each soil and contrasting inclusion in the detailed soil map units, the rangeland or woodland ecological site, the common plant name and scientific plant symbol for the characteristic vegetation, the average percent composition for each species in the potential plant community, the rangeland or woodland ecological site, and the total annual production of vegetation in favorable, normal, and unfavorable years. The characteristic vegetation, which consists of the grasses, forbs, shrubs, and immature trees that make up most of the potential plant community for each soil, is listed by common name. For rangeland, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals, the grazing season, and the availability of forage. Many plants, trees, and shrubs are inaccessible to foraging animals. For woodland, the percentage of the total annual production is not given because of a wide variation of production under different tree canopies. The presence of a plant species in the understory vegetation is shown by an "X" in the composition section of the table.

Total potential production is the amount of vegetation that can be expected to grow annually on well managed rangeland or woodland that supports the potential natural community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's production of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry

vegetation for favorable, normal, and unfavorable years. In a favorable year, above average amounts and optimum timing of precipitation during periods of warm temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture.

Riparian areas or meadows are interspersed throughout the survey area. Riparian vegetation grows on the flood plains along perennial streams. Stringer meadows are along spring-fed stream channels where moisture is available to plants throughout most of the growing season. Meadow vegetation also grows on the periphery of seeps and springs. Although they make up a small acreage in the survey area, the riparian zones are important because they provide free water, which improves the productivity of the riparian vegetation and lengthens the growing season of the vegetation. The zones are characterized by diverse plant species and a structural diversity of vegetation. The zones along stream channels are typically linear. The linear nature of the zones maximizes the edge effect between the zones and the adjacent uplands. An "edge," or ecotone, is a transition between plant communities or a joining of different vegetative structures within plant communities. It commonly is richer in wildlife than either of the adjoining communities.

Washoe County, Nevada, North Part is in the northwestern part of the Basin and Range Physiographic Province. The major plant associations in the survey area typify the general zonation of vegetation common in the Great Basin Region. Valley floors and the lower piedmont slopes are dominated by salt-desert shrub plant communities. Above the salt-desert shrub zone, sagebrush-grass plant communities are prevalent in areas where the mean annual precipitation is 8 inches or more.

Salt-desert shrub communities normally reflect either a climatically dry environment where the mean annual precipitation is less than 8 inches or physiologically dry soil conditions. High concentrations of salts that interfere with the uptake of water by plants can create physiologically dry soil conditions. Representative shrubs of the salt-desert shrub communities are shadscale, bud sagebrush, winterfat, and Douglas rabbitbrush. The common grasses include Indian ricegrass, bottlebrush squirreltail, Sandberg bluegrass, and desert needlegrass.

The salt-desert shrub plant communities in the survey area include stands dominated by a single shrub species and stands that support relatively heterogeneous mixtures of shrubs and grasses. The vegetation is generally sparse, normally covering less than 20 percent of the surface. Wind erosion and water erosion are hazards because of the naturally sparse plant cover in most areas. The interspaces between plants in salt-desert shrub communities commonly are stabilized by surface pavements of rock fragments, by a puddled and crusted soil surface, or by microphytic (algae) surface crusts. These protective features can be damaged by livestock or off-road vehicle traffic.

Salt-desert shrub plant communities are most valuable as winter range for livestock. They can produce high-quality winter forage and are usually subject to only light snowfall. Most of the desirable forage species in these communities are adversely affected by grazing in late winter (March and April), heavy use, or both. Where native rangeland communities are grazed in winter, an emergency supply of

feed should be readily available to carry livestock through periods of unusually severe weather.

Properly regulated grazing management can enhance the long-term productivity of salt-desert shrub plant communities. This management includes deferred grazing during critical growth periods in late winter, rotational grazing, and control of the intensity and season of use. Fencing, herding, water hauling, and controlling livestock access to watering facilities can achieve a better distribution of grazing. Because of the harsh environment of the salt-desert shrub zone, manipulation of vegetation and revegetation projects generally are not advisable.

Salt-desert shrub communities provide habitat for a wide variety of nongame species, including whiptail lizards, antelope ground squirrels, loggerhead shrikes, and Pacific rattlesnakes. Plant communities that are dominated by shadscale or winterfat and associated forbs and grasses provide important winter range for pronghorn antelope. Fencing can deter the migration of pronghorn antelope because these animals commonly do not jump. As a result, the lower wire of the fences should be high enough for antelope to crawl under. Where feasible, the fence lines should be routed so that they cause the least disruption to antelope travel. Livestock water developments are beneficial to antelope and other wildlife if the water is available when the animals occupy the area. Few mule deer use salt-desert shrub communities, which generally are unimportant in deer management. Feral horses use these communities in winter.

Within the salt-desert shrub zone are low areas that commonly receive extra moisture as runoff from higher landscape positions and as shallow, low-velocity overflow during periods of runoff. Black greasewood, basin big sagebrush, and basin wildrye are important plants on these sites. When in good condition, these plant communities can produce more than 2,000 pounds of basin wildrye per acre. When in poor condition, however, they typically produce less than 500 pounds per acre. The potential for increasing the production of basin wildrye is good on many sites in poor or fair condition in the survey area. Basin wildrye provides standing dried forage during its fall and winter dormancy and can provide calving areas in late winter. Mule deer, pygmy rabbits, and northern harrisers inhabit basin wildrye communities throughout the year.

Other plant communities that reflect extra moisture conditions are adjacent to valley floor playas. These areas may have a high water table during periods of runoff. Black greasewood, shadscale, inland saltgrass, and basin wildrye are the characteristic plants on these sites.

Plant communities that are dominated by black greasewood provide thermal cover for many species of wildlife but have limited value for big game. Because of its spines and coarse structure, black greasewood provides protective cover to nesting birds and small mammals. Although this species is not a preferred forage plant for livestock, cattle and sheep eat the succulent spring growth. On late fall and winter ranges, the fruit of black greasewood and shadscale provides nutritious and palatable feed. The soluble oxalates in black greasewood may be harmful to livestock, especially sheep, if the new growth is excessively grazed in spring.

As snow melts in spring, runoff commonly drains into valley floor basins. It remains for short periods, providing nesting and feeding habitat for some waterfowl. Playas

containing water in spring are important resting places for migrating waterfowl. Sand dunes formed through the deposition of windblown sediment are commonly on the leeward side of the playas in this survey area. Although of limited extent, partially stabilized sand dunes provide important habitat for both predator and prey vertebrate wildlife. Kangaroo rats, kit foxes, and bobcats inhabit the sand dunes.

Sagebrush-grass plant communities are at the lower elevations (4500 to 5500 feet) in the survey area. The average annual precipitation at these elevations is between 8 and 10 inches.

Wyoming big sagebrush, Lahontan sagebrush (a newly recognized subspecies of low sagebrush), and, to a lesser extent, basin big sagebrush are the dominant woody sagebrush plants at the lower elevations in the survey area. Cool-season perennial grasses are potentially the dominant herbaceous plants in the sagebrush-grass plant communities. Thurber needlegrass, Indian ricegrass, bottlebrush squirreltail, and Sandberg bluegrass are important cool-season bunch grasses. Grazing pressure has been severe on the sagebrush-grass plant communities at the lower elevations. These plant communities are the first to begin growth, or "greenup," during the warming periods of early spring and have traditionally been used for spring grazing by livestock. Close grazing spring after spring will eventually eliminate the perennial understory of grasses and forbs.

Grazing management practices can enhance the long-term productivity of sagebrush-grass communities. These practices include deferred grazing during critical growth periods in spring, rotational grazing, and control of the intensity and season of use. Fencing, herding, water hauling, and controlling livestock access to watering facilities can achieve a better distribution of grazing and facilitate grazing management.

Very few sources of perennial water are available in the sagebrush-grass zone at the lower elevations. Therefore, water developments and watering facilities are key elements in grazing management. Also, they can be of significant value to wildlife. Where the range condition has not deteriorated excessively and an adequate population of desirable perennial grasses and forbs is available to respond to a release from plant competition, brush management can greatly enhance the production of forage for livestock and wildlife.

The selection of plants available for rangeland seeding in the 8- to 10-inch precipitation zone is limited. Suitable species that are tolerant of early spring grazing, however, can be seeded. These species can play a key role in the management of grazing on the adjacent native sagebrush-grass and salt-desert shrub plant communities. Years of below normal precipitation are relatively frequent in this zone. Thus, the factors to be considered in managing rangeland seeding include the risk of seeding failure caused by climate.

Although the sagebrush-grass communities at the lower elevations may provide transitional spring range to pronghorn antelope moving from winter to summer ranges, plant communities that are dominated by big sagebrush are not heavily used by the antelope. Fencing can deter migration of the antelope because these animals commonly do not jump. As a result, the lower wire of the fences should be high enough for the antelope to crawl under. Where feasible, the fence lines should be routed so

that they cause the least disruption to antelope travel. Livestock water developments are beneficial to wildlife, especially deer and antelope, if the water is available when the animals are in the area.

During severe winters in areas of the sagebrush-grass communities at the lower elevations, sage grouse may feed on sagebrush that has not been covered by snow. Heavy snow at the higher elevations forces chukar partridge to move into these areas in search of food. The sagebrush-grass communities at the lower elevations are used primarily by mule deer and feral horses as winter range or as transitional range in spring. Spring grazing by livestock in areas used by deer as winter range should be managed so that the turn out of livestock is delayed until after spring "greenup" and the migration of most of the deer.

Sagebrush-grass communities are at intermediate elevations (5500 to 6800 feet) in the survey area. The average annual precipitation at these elevations is between 10 and 14 inches.

Wyoming big sagebrush dominates the shrub canopy of the mid-elevation plant communities on the warmer, drier exposures. Basin big sagebrush is most common on the deeper soils at the lower elevations in this precipitation zone. Mountain big sagebrush is prevalent on the north aspects at the lower elevations of the zone and grows on all aspects at the higher elevations. Low sagebrush is the dominant dwarf sagebrush at the mid and upper elevations in the survey area. Bluebunch wheatgrass, Thurber needlegrass, Canby bluegrass, Sandberg bluegrass, and basin wildrye are the major perennial grasses associated with these mid-elevation sagebrush-grass communities. Antelope bitterbrush is an important shrub in many plant communities at these elevations.

The mid-elevation sagebrush-grass communities are suitable for grazing by livestock in summer and fall. Deferred grazing during critical growth periods in spring and early summer, rotational grazing, and control of the intensity and season of use can enhance the long-term productivity of these communities. Fencing, herding, and strategically locating livestock watering facilities help to achieve a better distribution of grazing and facilitate grazing management. Relatively few sources of perennial water are available in areas of the mid-elevation sagebrush-grass zone. As a result, water developments and watering facilities are key elements in grazing management and can be of significant value to wildlife.

Wyoming big sagebrush communities at mid elevations are used primarily as winter range by mule deer. They commonly provide habitat for Brewer's sparrow, black-tailed jackrabbits, and sagebrush lizards. They provide wintering areas for sage grouse. Low sagebrush communities provide important summer range for pronghorn antelope and brood-rearing habitat for sage grouse. Livestock water developments can be beneficial to wildlife, especially deer and antelope, if the water is available when the animals are in the area. Mountain big sagebrush and low sagebrush communities provide spring, summer, and fall range for mule deer and feral horses.

Seasonal grazing by livestock removes old grass residue and exposes the regrowth of succulent green stems and leaves that provide food for mule deer. The steep rock-faced cliffs common to these mid elevations have ledges, joints, cracks, and occasional caves and thus provide safe

sites for birds and small mammals to nest and rear their young. The common nongame species are sage thrasher, the Great Basin gopher snake, and desert mouse. Areas of exposed lava flow rock, natural breaks in the cliffs, and the associated talus commonly are used as travel lanes by wildlife, including mule deer.

Brush management practices can be very effective in increasing the production of native forage in the mid-elevation sagebrush-grass zone. They can be beneficial to wildlife as well as livestock. Opening up large, homogeneous stands of sagebrush commonly improves the habitat for wildlife, such as mule deer and pronghorn antelope. Rangeland seeding may be required following the removal of woody vegetation where desirable understory plants are scarce or are not included in the present plant community. A number of forbs and grasses are suitable for dryland seeding in the 10-to 14-inch precipitation zone. Including suitable forbs in the seeding mixture helps to provide additional forage for wildlife, such as pronghorn antelope, mule deer, and sage grouse.

Western juniper plant communities are at mid-elevations in the survey area. Local expansion of western juniper from woodland sites to the adjacent rangeland is common. The invasion of western juniper into sagebrush-grass communities has been attributed to overgrazing, a scarcity of naturally recurring fires, and climatic conditions. Young trees are readily killed by fire. The loss of fine fuel to carry fire and, to a lesser extent, fire control have limited the frequency and extent of natural fires in the sagebrush-grass zone. This reduction in the frequency of fires has allowed seedlings to become established in increasing numbers on sites that at one time supported virtually no trees.

Livestock commonly concentrate on the woodland sites, taking advantage of the shade and shelter provided by the tree overstory. These sites also provide habitat for nongame wildlife species, including the bushy-tailed woodrat, the blue-grey gnat-catcher, and the American kestrel; thermal cover for mule deer; and habitat for small mammals and birds.

Areas that have a heterogeneous mixture of vegetative types, including grassland, low shrub, tall shrub, and tree-shrub communities, generally provide an optimum diversity of wildlife habitat. These types of vegetative complexes are common in the sagebrush-grass zones at the intermediate and upper elevations. Moderate browsing by cattle on antelope bitterbrush in fall can enhance the vigor and growth of the bitterbrush, which is later available for grazing by mule deer and antelope.

Stringer meadows are along spring-fed stream channels in the sagebrush-grass zones at the intermediate and upper elevations. Meadow vegetation also grows on the periphery of seeps and springs. Wet meadows adjacent to sagebrush stands are important as brood-rearing areas for sage grouse. During the first weeks after leaving the nest, sage grouse chicks eat mainly insects (ants and beetles) and the succulent forbs that are common in wet meadows. Grazing of the meadows by cattle can improve the quality of feed for sage grouse if a period of regrowth is provided for the key forb species. Grazing increases the succulence of the forbs by interrupting the maturation of the plant tissues. The succulent or young leaf tissue is higher in protein and lower in fiber than mature tissue. As they seek sources of succulent forbs, sage grouse select meadows that have been grazed by cattle. Sage grouse chicks find

food and cover in properly grazed meadows, which appear patchy because of different stubble heights remaining after livestock have grazed the meadows.

Improper grazing of riparian vegetation by livestock can cause gully erosion. This erosion, in turn, can result in lower water tables, the drying out of meadows, and the loss of valuable wildlife and livestock forage. Grazing management strategies that are sensitive to the development and maintenance of healthy riparian areas are needed.

The uppermost elevations of the survey area (5800 to 7000 feet) typically support high-elevation sagebrush-grass plant communities. The average annual precipitation ranges from 14 to more than 18 inches. Mountain big sagebrush and low sagebrush dominate the shrub canopy of these plant communities. The shrub understory grasses include Idaho fescue, western needlegrass, mountain brome, Columbia needlegrass, Letterman needlegrass, basin wildrye, slender wheatgrass, and bluebunch wheatgrass. Mountain browse species, such as snowberry, serviceberry, and antelope bitterbrush, are common in the shrub overstory. Curlleaf mountainmahogany stands are at the highest elevations, on mountain summits, and the upper side slopes. Areas of aspen woodland are common in concave pockets and along riparian zones.

Plant communities on the high-elevation sites are potentially very productive and normally respond rapidly to management. These sites remain cold and wet through spring and into early summer. They are used as summer range for livestock. Grazing should be delayed until the surface layer has dried sufficiently for compaction to be limited. Snow often blankets these sites by late fall, further restricting the period of livestock grazing. Steeply sloping areas are common throughout the high-elevation sagebrush-grass zone. Livestock tend to overuse the less sloping areas unless grazing is managed for an even distribution of grazing. Fencing, properly locating watering facilities, and herding force livestock to use areas that otherwise might remain ungrazed. Salt and mineral blocks should be placed away from water.

Mule deer use the high-elevation plant communities for summer range. North-facing slopes that have a patchwork of dense stands consisting of mountain browse are important deer-fawning areas. These dense stands should be maintained because they provide cover for wildlife. Areas of aspen woodland provide important cover for wildlife and are a source of shade for livestock and wildlife.

Seeps and springs are common at the high elevations. Water for livestock generally is readily available. Additional water developments may be needed, however, to distribute the livestock evenly. Developed springs, pipelines, and storage tanks are dependable means of supplying water. Seeps and springs developed to provide livestock water can also be beneficial to wildlife. Excluding livestock by fencing the meadow around a seep or spring and piping the water to troughs or other storage facilities outside the enclosure help to protect the meadow vegetation grazed by wildlife. Enough water must be retained in the fenced seep or spring area to maintain the meadow vegetation. Small meadows can be developed and maintained by piping overflow water from livestock troughs into fenced areas.

Many naturally occurring meadows in the sagebrush-grass zones at the mid and higher elevations have been heavily invaded by big sagebrush. The sagebrush depletes moisture from the meadows. If the sagebrush is removed, the quantity of water and the duration of waterflow increase as grasses return to the meadows. Prescribed burning of dense sagebrush stands can be an economical means of brush management in the high-elevation sagebrush-grass zone. Brush management practices should be designed so that enough of the shrub canopy remains near meadows to provide cover for wildlife.

Rangeland seeding of the high-elevation plant communities is usually not necessary. In most areas, the remnant population of desirable forbs and grasses is sufficient to respond to grazing management and a release from shrub competition. Where rangeland seeding is needed, a wide variety of suitable species can be planted because of the relatively high annual precipitation in this zone.

Forest Land

Table 8, "Woodland Management and Productivity" can be used by forest managers in planning the use of soils for wood crops. Only those soils suitable for wood crops are listed.

Woodland Ordination System

Table 8, "Woodland Management and Productivity" lists the ordination (woodland suitability) symbol for each soil. The ordination system is a nationwide uniform system of labeling soils or groups of soils that are similar in use and management. The primary factors evaluated in the woodland ordination system are productivity of the forest overstory tree species and the principal soil properties resulting in hazards and limitations that affect forest management. There are three parts of the ordination system: class, subclass, and group. The class and subclass are referred to as the ordination symbol.

Ordination Class Symbol

The first element of the ordination symbol is a number that denotes potential productivity in terms of cubic meters of wood per hectare per year for the indicator tree species. The larger the number, the greater the potential productivity. Potential productivity is based on site index and the corresponding culmination of mean annual increment. For example, the number 1 indicates a potential production of 1 cubic meter of wood per hectare per year (14.3 cubic feet per acre per year) and 10 indicates a potential production of 10 cubic meters of wood per hectare per year (143 cubic feet per acre per year).

Indicator species is a species that is common in the area and is generally, but not necessarily, the most productive on the soil. It is the species that determines the ordination class. It is the first species listed for a particular map unit in table 8. This table shows the productivity for all species where data have been collected.

Site index is determined by taking height measurements and determining the age of selected trees within stands of a given species. This index is the average height, in feet, that the trees attain in a specified number of years. This index applies to fully stocked, even-aged, unmanaged stands. The site indexes shown in table 8, "Woodland Management and

Productivity," are averages based on measurements made at sites that are representative of the soil series. When the site index and forest land productivity of different soils are compared, the values for the same tree species should be compared. The higher the site index number, the more productive the soil for that species. Site index values are used in conjunction with yield tables to determine average annual yields. Indirectly, they are used to determine the productivity class in the ordination class symbol.

Ordination Subclass Symbol

The second element of the ordination symbol, or subclass, is a capital letter that indicates certain soil or physiographic characteristics that contribute to important hazards or limitations to be considered in management. The subclasses are defined as follows:

Subclass X indicates that forest land use and management are limited by stones or rocks.

Subclass W indicates that forest land use and management are significantly limited by excess water, either seasonally or throughout the year. Restricted drainage, a high water table, or flooding can adversely affect either stand development or management.

Subclass T indicates that the root zone has toxic substances. Excessive alkalinity, acidity, sodium salts, or other TOXIC substances impede the development of desirable species.

Subclass D indicates that forest land use and management are limited by a restricted rooting depth. The rooting depth is restricted by hard bedrock, a hardpan, or other restrictive layers in the soil.

Subclass C indicates that forest land use and management are limited by the kind or amount of clay in the upper part of the soil.

Subclass S indicates that the soil is sandy, has a low available water capacity, and normally has a low content of available plant nutrients. The use of equipment is limited during dry periods.

Subclass F indicates that forest land use and management are limited by a high content of rock fragments that are larger than 2 millimeters and smaller than 10 inches. This subclass includes flaggy soils.

Subclass R indicates that forest land use and management are limited by excessive slope.

Subclass A indicates that no significant limitations affect forest land use and management.

Forest Land Management and Productivity

Information about the productivity and management of the forested map units in the survey area is given in table 8, "Woodland Management and Productivity."

Management Concerns

In table 8, "Woodland Management and Productivity," the soils are rated for the erosion hazard, the equipment limitation, seedling mortality, the windthrow hazard, and plant competition.

The *erosion hazard* is *slight* if the expected soil loss is small; *moderate* if some measures are needed to control erosion during logging and road construction; and *severe* if intensive management or special equipment and methods are needed to prevent excessive soil loss.

The *equipment limitation* is *slight* if the use of equipment is not limited to a particular kind of equipment or time of year; *moderate* if there is a short seasonal limitation or a need for some modification in the management of equipment; and *severe* if there is a seasonal limitation, a need for special equipment or management, or a hazard in the use of equipment.

Seedling mortality ratings are for seedlings that are from a good planting stock and that are properly planted during a period of average rainfall. A rating of *slight* indicates that the expected mortality of the planted seedlings is less than

25 percent; *moderate*, 25 to 50 percent; and *severe*, more than 50 percent.

Windthrow hazard is *slight* if trees in wooded areas are not expected to be blown down by commonly occurring winds; *moderate* if some trees are blown down during periods of excessive soil wetness and strong winds; and *severe* if many trees are blown down during periods of excessive soil wetness and moderate or strong winds.

Plant competition is *slight* if there is little or no competition from other plants; *moderate* if plant competition is expected to hinder the development of a fully stocked stand of desirable trees; and *severe* if plant competition is expected to prevent the establishment of a desirable stand unless the site is intensively prepared, weeded, or otherwise managed for the control of undesirable plants.

Potential Productivity

The potential productivity of merchantable or *common trees* is expressed as a site index, which is described under the heading "Ordination Class Symbol." Commonly grown trees are those that forest land managers generally favor in intermediate or improvement cuttings. They are selected on the basis of growth rate, quality, value, and marketability.

Wildlife Habitat

Soils affect the kind and amount of vegetation that is available to wildlife as food and cover. They also affect the construction of water impoundments. If food, cover, or water is missing, inadequate, or inaccessible, wildlife will be scarce or will not inhabit the area.

If the soils have potential for habitat development, wildlife habitat can be created or improved by planting appropriate vegetation, properly managing the existing plant cover, and fostering the natural establishment of desirable plants. The soils in the survey area are rated in table 9, "Wildlife Habitat."

Elements of Wildlife Habitat

The elements of wildlife habitat are described in the following paragraphs.

Grain and seed crops are domestic grains and seed-producing herbaceous plants used by wildlife. Examples are wheat, rye, oats, and barley.

Grasses and legumes are domestic perennial grasses and herbaceous legumes planted for wildlife food and cover. Examples are fescue, brome grass, timothy, orchardgrass, clover, alfalfa, trefoil, and reed canarygrass.

Wild herbaceous plants are native or naturally established grasses and forbs, including weeds, that provide food and cover for wildlife. Examples are goldenrod, lambsquarters, arrowleaf balsamroot, dandelions, ragweed, wheatgrass, fescue, and nightshade.

The major soil properties affecting the growth of grain and forage crops and wild herbaceous plants are depth of the root zone, texture of the surface layer, the amount of water available to plants, wetness, salinity or sodicity, and flooding. The length of the growing season also is important.

Hardwood trees and woody understory produce nuts or other fruit, buds, catkins, twigs, bark, and foliage that wildlife eat. Examples are oak, cottonwood, quaking aspen, boxelder, maple, green ash and willow. Examples of fruit-producing shrubs that are suitable for planting on soils that have good potential for these plants are hawthorn, honeysuckle, American plum, redosier dogwood, chokecherry, serviceberry, and silver buffaloberry.

Coniferous plants are cone-bearing trees, shrubs, or ground cover that provide habitat or supply food in the form of browse, seed, or fruitlike cones. Examples are pine, spruce, hemlock, fir, and juniper.

The major soil properties affecting the growth of hardwood and coniferous trees and shrubs are depth of root zone, the amount of water available to plants, and wetness.

Wetland plants are annual and perennial wild herbaceous plants that grow on moist or wet sites. Submerged or floating aquatic plants are excluded. Wetland plants produce food or cover for wetland wildlife. Examples of these plants are smartweed, rushes, sedges, bulrushes, and cattail.

The major soil properties affecting wetland plants are texture of the surface layer, wetness, acidity or alkalinity, and slope.

Shallow water areas have an average depth of less than 5 feet. They are useful as habitat for some wildlife species. They are naturally wet areas or are created by dams, levees, or water-control measures in marshes or streams. Examples are muskrat marshes, waterfowl feeding areas, wildlife watering developments, beaver ponds, and other wildlife ponds.

The major soil properties affecting shallow water areas are depth to bedrock, wetness, surface stoniness, slope, and permeability.

Kinds of Wildlife Habitat

Habitat for openland wildlife consists of cropland, pasture, meadows, and areas that are overgrown with grasses, herbs, and shrubs. These areas produce grain and seed crops, grasses and legumes, and wild herbaceous plants. The wildlife attracted to these areas include Hungarian partridge, pheasant, sage grouse, meadowlark, field sparrow, killdeer, cottontail rabbit, and red fox.

Habitat for woodland wildlife consists of areas of hardwoods or conifers or a mixture of these and associated grasses, legumes, and wild herbaceous plants. The wildlife attracted to this habitat include wild turkey, grouse, thrushes, woodpeckers, owls, porcupine, raccoon, deer, and elk.

Habitat for wetland wildlife consists of open, marshy or swampy, shallow water areas that support water-tolerant plants. The wildlife attracted to this habitat include ducks, geese, herons, bitterns, rails, kingfishers, muskrat, and beaver.

Habitat for rangeland wildlife consists of areas of shrubs and wild herbaceous plants. The wildlife attracted to rangeland include antelope, mule deer, sage grouse, meadowlark, and lark bunting.

Recreation

The soils of the survey area are rated in table 10, "Recreational Development," according to limitations that affect their suitability for recreation. The ratings are based on restrictive soil features, such as wetness, slope, and texture of the surface layer. Susceptibility to flooding is considered. Not considered in the ratings, but important in evaluating a site, are the location and accessibility of the area, the size and shape of the area and its scenic quality, the ability of the soil to support vegetation, access to water, potential water impoundment sites, and either access to public sewer lines or the capacity of the soil to absorb septic tank effluent. Soils subject to flooding are limited, in varying degrees, for recreational uses by the duration of flooding and the season when it occurs. Onsite assessment of the height, duration, intensity, and frequency of flooding is essential in planning recreational facilities.

Camp areas are tracts of land used intensively as sites for tents, trailers, and campers and for outdoor activities that accompany such sites. These areas require site preparation, such as shaping and leveling the tent and parking areas, stabilizing roads and intensively used areas, and installing sanitary facilities and utility lines. Camp areas are subject to heavy foot traffic and some vehicular traffic. The soils are rated on the basis of soil properties that influence the ease of developing camp areas and performance of the areas after development. Also considered are the soil properties that influence trafficability and promote the growth of vegetation after heavy use.

Picnic areas are natural or landscaped tracts of land that are subject to heavy foot traffic. Most vehicular traffic is confined to access roads and parking areas. The soils are rated on the basis of soil properties that influence the cost of shaping the site, trafficability, and the growth of vegetation after development. The surface of picnic areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry.

Playgrounds are areas used intensively for baseball, football, or similar activities. These areas require a nearly level soil that is free of stones and that can withstand heavy foot traffic and maintain an adequate cover of vegetation. The soils are rated on the basis of soil properties that influence the cost of shaping the site, trafficability, and the growth of vegetation. Slope and stoniness are the main concerns in developing playgrounds. The surface of the playgrounds should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry.

Paths and trails are areas used for hiking and horseback riding. The areas should require little or no cutting and filling during site preparation. The soils are rated on the basis of soil properties that influence trafficability and erodibility. Paths and trails should remain firm under foot traffic and not be dusty when dry.

Golf fairways are subject to heavy foot traffic and some light vehicular traffic. Cutting or filling may be required. The best soils for use as golf fairways are firm when wet, are not dusty when dry, and are not subject to prolonged flooding during the period of use. They have moderate slopes and no stones or boulders on the surface. The suitability of the soil for tees or greens is not considered in rating the soils.

The interpretative ratings in this table help engineers, planners, and others to understand how soil properties influence recreational uses. Ratings for proposed uses are given in terms of limitations. Only the most restrictive features are listed. Other features may limit a specific recreational use.

The degree of soil limitation is expressed as slight, moderate, or severe.

Slight means that soil properties are favorable for the rated use. The limitations are minor and can be easily overcome. Good performance and low maintenance are expected.

Moderate means that soil properties are moderately favorable for the rated use. The limitations can be overcome or modified by special planning, design, or maintenance. During some part of the year, the expected performance may be less desirable than that of soils rated *slight*.

Severe means that soil properties are unfavorable for the rated use. Examples of limitations are slope, bedrock near the surface, flooding, and a seasonal high water table. These limitations generally require major soil reclamation, special design, or intensive maintenance. Overcoming the limitations generally is difficult and costly.

The information in the table "Recreational Development," can be supplemented by other information in this survey, for example, interpretations for dwellings without basements and for local roads and streets in table 11, "Building Site Development," and interpretations for septic tank absorption fields in table 12, "Sanitary Facilities."

Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the estimated data and test data in the "Soil Properties" section.

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil within a depth of 5 or 6 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about grain-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 or 6 feet of the surface, soil wetness, depth to a seasonal high water table, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kind of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and

pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the "Glossary."

Building Site Development

Table 11, "Building Site Development," shows the degree and kind of soil limitations that affect shallow excavations, dwellings with and without basements, small commercial buildings, local roads and streets, and lawns and landscaping. The limitations are considered *slight* if soil properties and site features generally are favorable for the indicated use and limitations are minor and easily overcome; *moderate* if soil properties or site features are not favorable for the indicated use and special planning, design, or maintenance is needed to overcome or minimize the limitations; and *severe* if soil properties or site features are so unfavorable or so difficult to overcome that special design, significant increases in construction costs, and possibly increased maintenance are required. Special feasibility studies may be required where the soil limitations are severe.

Shallow excavations are trenches or holes dug to a maximum depth of 5 or 6 feet for basements, graves, utility lines, open ditches, and other purposes. The ratings are based on soil properties, site features, and observed performance of the soils. The ease of digging, filling, and compacting is affected by the depth to bedrock, a cemented pan, or a very firm dense layer; stone content; soil texture; and slope. The time of the year that excavations can be made is affected by the depth to a seasonal high water table and the susceptibility of the soil to flooding. The resistance of the excavation walls or banks to sloughing or caving is affected by soil texture and depth to the water table.

Dwellings and small commercial buildings are structures built on shallow foundations on undisturbed soil. The load limit is the same as that for single-family dwellings no higher than three stories. Ratings are made for small commercial buildings without basements, for dwellings with basements, and for dwellings without basements. The ratings are based on soil properties, site features, and observed performance of the soils. A high water table, flooding, shrinking and swelling, and organic layers can

cause the movement of footings. A high water table, depth to bedrock or to a cemented pan, large stones, and flooding affect the ease of excavation and construction. Landscaping and grading that require cuts and fills of more than 5 or 6 feet are not considered.

Local roads and streets have an all-weather surface and carry automobile and light truck traffic all year. They have a subgrade of cut or fill soil material; a base of gravel, crushed rock, or stabilized soil material; and a flexible or rigid surface. Cuts and fills generally are limited to less than 6 feet. The ratings are based on soil properties, site features, and observed performance of the soils. Depth to bedrock or to a cemented pan, a high water table, flooding, large stones, and slope affect the ease of excavating and grading. Soil strength (as inferred from the engineering classification of the soil), shrink-swell potential, potential for frost action, and depth to a high water table affect the traffic-supporting capacity.

Lawns and landscaping require soils on which turf and ornamental trees and shrubs can be established and maintained. The ratings are based on soil properties, site features, and observed performance of the soils. Soil reaction, a high water table, depth to bedrock or to a cemented pan, the available water capacity in the upper 40 inches, and the content of salts, sodium, and sulfidic materials affect plant growth. Flooding, wetness, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer affect trafficability after vegetation is established.

Sanitary Facilities

Table 12, "Sanitary Facilities," shows the degree and the kind of soil limitations that affect septic tank absorption fields, sewage lagoons, and sanitary landfills. It also shows the suitability of the soils for use as a daily cover for landfill.

Soil properties are important in selecting sites for sanitary facilities and in identifying limiting soil properties and site features to be considered in planning, design, and installation. Soil limitation ratings of *slight*, *moderate*, or *severe* are given for septic tank absorption fields, sewage lagoons, and trench and area sanitary landfills. Soil suitability ratings of *good*, *fair*, and *poor* are given for daily cover for landfill.

A rating of *slight* or *good* indicates that the soils have no limitations or that the limitations can be easily overcome. Good performance and low maintenance can be expected. A rating of *moderate* or *fair* indicates that the limitations should be recognized but generally can be overcome by good management or special design. A rating of *severe* or *poor* indicates that overcoming the limitations is difficult or impractical. Increased maintenance may be required.

Septic tank absorption fields are areas in which subsurface systems of tile or perforated pipe distribute effluent from a septic tank into the natural soil. The centerline of the tile is assumed to be at a depth of 24 inches. Only the part of the soil between depths of 24 and 60 inches is considered in making the ratings. The soil properties and site features considered are those that affect the absorption of the effluent, those that affect the construction and maintenance of the system, and those that may affect public health.

The ratings are based on soil properties, site features, and observed performance of the soils. Permeability, a high water table, depth to bedrock or to a cemented pan, and flooding affect absorption of the effluent. Large stones and bedrock or a cemented pan interfere with installation.

Unsatisfactory performance of septic tank absorption fields, including excessively slow absorption of effluent, surfacing of effluent, and hillside seepage, can affect public health. Ground water can be polluted if highly permeable sand and gravel or fractured bedrock is less than 4 feet below the base of the absorption field, if slope is excessive, or if the water table is near the surface. There must be unsaturated soil material beneath the absorption field to filter the effluent effectively. Many local ordinances require that this material be a certain thickness.

Sewage lagoons are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted, relatively impervious soil material. Aerobic lagoons generally are designed to hold the sewage within a depth of 2 to 5 feet. Relatively impervious soil material for the lagoon floor and sides is desirable to minimize seepage and contamination of local ground water.

Table 12, "Sanitary Facilities," gives ratings for the natural soil that makes up the lagoon floor. The surface layer and, generally, 1 or 2 feet of soil material below the surface layer are excavated to provide material for the embankments. The ratings are based on soil properties, site features, and observed performance of the soils. Considered in the ratings are slope, permeability, a high water table, depth to bedrock or to a cemented pan, flooding, large stones, and content of organic matter.

Excessive seepage resulting from rapid permeability in the soil or a water table that is high enough to raise the level of sewage in the lagoon causes a lagoon to function unsatisfactorily. Pollution results if seepage is excessive or if floodwater overtops the lagoon. A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor.

Trench sanitary landfill is an area where solid waste is disposed of by placing refuse in successive layers in an excavated trench. The waste is spread, compacted, and covered daily with a thin layer of soil that is excavated from the trench. When the trench is full, a final cover of soil material at least 2 feet thick is placed over the landfill. Soil properties that influence the risk of pollution, the ease of excavation, trafficability, and revegetation are the major considerations in rating the soils.

Area sanitary landfill is an area where solid waste is disposed of by placing refuse in successive layers on the surface of the soil. The waste is spread, compacted, and covered daily with a thin layer of soil that is imported from a source away from the site. A final cover of soil at least 2 feet thick is placed over the completed landfill. Soil properties that influence trafficability, revegetation, and the risk of pollution are the main considerations in rating the soils for area sanitary landfills.

Both types of landfill must be able to bear heavy vehicular traffic. Both types involve a risk of ground-water pollution. The ratings in the table "Sanitary Facilities" are based on soil properties, site features, and observed

performance of the soils. Permeability, depth to bedrock or to a cemented pan, a high water table, slope, and flooding affect both types of landfill. Texture, stones and boulders, highly organic layers, soil reaction, and content of salts and sodium affect trench type landfills. Unless otherwise stated, the ratings apply only to that part of the soil within a depth of about 6 feet. For deeper trenches, a limitation rated slight or moderate may not be valid. Onsite investigation is needed.

Daily cover for landfill is the soil material that is used to cover compacted solid waste in an area sanitary landfill. The soil material is obtained offsite, transported to the landfill, and spread over the waste. The suitability of a soil for use as cover is based on properties that affect workability and the ease of digging, moving, and spreading the material over the refuse daily during both wet and dry periods.

Soil texture, wetness, rock fragments, and slope affect the ease of removing and spreading the material during wet and dry periods. Loamy or silty soils that are free of large stones or excess gravel are the best cover for a landfill. Clayey soils are sticky or cloddy and are difficult to spread; sandy soils are subject to soil blowing.

After soil material has been removed, the soil material remaining in the borrow area must be thick enough over bedrock, a cemented pan, or the water table to permit revegetation. The soil material used as final cover for a landfill should be suitable for plants. The surface layer generally has the best workability, more organic matter, and the best potential for plants. Material from the surface layer should be stockpiled for use as the final cover.

Waste Management

Soil properties are important when organic waste is applied as fertilizer and wastewater is applied in irrigated areas. They also are important when the soil is used as a medium for the treatment and disposal of the organic waste and wastewater. Unfavorable soil properties can result in environmental damage.

The use of organic waste and wastewater as production resources results in energy and resource conservation and minimizes the problems associated with waste disposal. If disposal is the goal, applying a maximum amount of the organic waste or the wastewater to a minimal area holds costs to a minimum and environmental damage is the main hazard. If reuse is the goal, a minimum amount should be applied to a maximum area and environmental damage is unlikely.

Interpretations developed for waste management may include ratings for manure- and food-processing waste, municipal sewage sludge, use of wastewater for irrigation, and treatment of wastewater by slow rate, overland flow, and rapid infiltration processes.

Specific information regarding waste management is available at the local office of the Natural Resources Conservation Service or Nevada Cooperative Extension.

Construction Materials

Table 13, "Construction Materials," gives information about the soils as a source of roadfill, sand, gravel, and

topsoil. The soils are rated *good*, *fair*, or *poor* as a source of roadfill and topsoil. They are rated as a *probable* or *improbable* source of sand and gravel.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In table 13 "Construction Materials," the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the soil material below the surface layer to a depth of 5 or 6 feet. It is assumed that soil layers will be mixed during excavating and spreading. Many soils have layers of contrasting suitability within their profile. Table 15, "Engineering Index Properties," provides detailed information about each soil layer. This information can help to determine the suitability of each layer for use as roadfill. The performance of soil after it is stabilized with lime or cement is not considered in the ratings.

The ratings are based on soil properties, site features, and observed performance of the soils. The thickness of suitable material is a major consideration. The ease of excavation is affected by large stones, a high water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the engineering classification of the soil) and shrink-swell potential.

Soils rated *good* contain significant amounts of sand or gravel, or both. They have at least 5 feet of suitable material, a low shrink-swell potential, few cobbles and stones, and slopes of 15 percent or less. Depth to the water table is more than 3 feet. Soils rated *fair* are more than 35 percent silt- and clay-sized particles and have a plasticity index of less than 10. They have a moderate shrink-swell potential, slopes of 15 to 25 percent, or many stones. Depth to the water table is 1 to 3 feet. Soils rated *poor* have one or more of the following characteristics: a plasticity index of more than 10, a high shrink-swell potential, many stones, slopes of more than 25 percent, or a water table at a depth of less than 1 foot. They may have layers of suitable material, but the material is less than 3 feet thick.

Sand and *gravel* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In the table "Construction Materials," only the probability of finding material in suitable quantity in or below the soil is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material.

The properties used to evaluate the soil as a source of sand or gravel are gradation of grain sizes (as indicated by the engineering classification of the soil), the thickness of suitable material, and the content of rock fragments. Kinds of rock, acidity, and stratification are given in the soil series descriptions. Gradation of grain sizes is given in table 15, "Engineering Index Properties."

A soil rated as a probable source has a layer of clean sand or gravel or a layer of sand or gravel that is as much as 12 percent silty fines. This material must be at least 3 feet thick and less than 50 percent, by weight, large stones. All other soils are rated as an improbable source. Fragments of soft bedrock, such as shale and siltstone, are not considered to be sand and gravel.

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a

soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area.

Plant growth is affected by toxic material and by such properties as soil reaction, available water capacity, and fertility. The ease of excavating, loading, and spreading is affected by rock fragments, slope, a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, a water table, rock fragments, bedrock, and toxic material.

Soils rated *good* have friable, loamy material to a depth of at least 40 inches. They are free of stones and cobbles, have little or no gravel, and have slopes of less than 8 percent. They are low in content of soluble salts, are naturally fertile or respond well to fertilizer, and are not so wet that excavation is difficult.

Soils rated *fair* are sandy soils, loamy soils that have a relatively high content of clay, soils that have only 20 to 40 inches of suitable material, soils that have an appreciable amount of gravel, stones, or soluble salts, or soils that have slopes of 8 to 15 percent. The soils are not so wet that excavation is difficult.

Soils rated *poor* are very sandy or clayey; have less than 20 inches of suitable material; have a large amount of gravel, stones, or soluble salts; have slopes of more than 15 percent; or have a seasonal high water table at or near the surface.

The surface layer of most soils generally is preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

Water Management

Table 14, "Water Management" gives information on the soil properties and site features that affect water management. The degree and kind of soil limitations are given for pond reservoir areas; embankments, dikes, and levees; and aquifer-fed excavated ponds. The limitations are considered *slight* if soil properties and site features generally are favorable for the indicated use and limitations are minor and are easily overcome; *moderate* if soil properties or site features are not favorable for the indicated use and special planning, design, or maintenance is needed to overcome or minimize the limitations; and *severe* if soil properties or site features are so unfavorable or so difficult to overcome that special design, significant increase in construction costs, and possibly increased maintenance are required.

This table also gives for each soil the restrictive features that affect drainage, irrigation, terraces and diversions, and grassed waterways.

Pond reservoir areas hold water behind a dam or embankment. Soils best suited to this use have low seepage potential in the upper 60 inches. The seepage potential is determined by the permeability of the soil and the depth to fractured bedrock or other permeable material. Excessive slope can affect the storage capacity of the reservoir area.

Embankments, dikes, and levees are raised structures of soil material, generally less than 20 feet high, constructed to impound water or to protect land against overflow. In table 14, "Water Management," the soils are rated as a source of material for embankment fill. The ratings apply to

the soil material below the surface layer to a depth of about 5 feet. It is assumed that soil layers will be uniformly mixed and compacted during construction.

The ratings do not indicate the ability of the natural soil to support an embankment. Soil properties to a depth even more than the height of the embankment can affect performance and safety of the embankment. Generally, deeper onsite investigation is needed to determine these properties.

Soil material in embankments must be resistant to seepage, piping, and erosion and have favorable compaction characteristics. Unfavorable features include less than 5 feet of suitable material and a high content of stones or boulders, organic matter, or salts or sodium. A high water table affects the amount of usable material. It also affects trafficability.

Aquifer-fed excavated ponds are pits or dugouts that extend to a ground-water aquifer or to a depth below a permanent water table. Excluded are ponds that are fed only by surface runoff and embankment ponds that impound water 3 feet or more above the original surface. Excavated ponds are affected by depth to a permanent water table, permeability of the aquifer, and quality of the water as inferred from the salinity of the soil. Depth to bedrock and the content of large stones affect the ease of excavation.

Drainage is the removal of excess surface and subsurface water from the soil. How easily and effectively the soil is drained depends on the depth to bedrock, to a cemented pan, or to other layers that affect the rate of water movement; permeability; depth to a high water table or depth of standing water if the soil is subject to ponding; slope; susceptibility to flooding; subsidence of organic layers; and the potential for frost action. Excavating and grading and the stability of ditchbanks are affected by depth to bedrock or to a cemented pan, large stones, slope, and the hazard of cutbanks caving. The productivity of the soil after drainage is adversely affected by extreme acidity or by toxic substances in the root zone, such as salts, sodium, or sulfur. Availability of drainage outlets is not considered in the ratings.

Irrigation is the controlled application of water to supplement rainfall and support plant growth. The design and management of an irrigation system are affected by depth to the water table, the need for drainage, flooding, available water capacity, intake rate, permeability, erosion hazard, and slope. The construction of a system is affected by large stones and depth to bedrock or to a cemented pan. The performance of a system is affected by the depth of the root zone, the amount of salts or sodium, and soil reaction.

Terraces and diversions are embankments or a combination of channels and ridges constructed across a slope to control erosion and conserve moisture by intercepting runoff.

Slope, wetness, large stones, and depth to bedrock or to a cemented pan affect the construction of terraces and diversions. A restricted rooting depth, a severe hazard of soil blowing or water erosion, an excessively coarse texture, and restricted permeability adversely affect maintenance.

Grassed waterways are natural or constructed channels, generally broad and shallow, that conduct surface water to outlets at a nonerosive velocity. Large stones, wetness, slope, and depth to bedrock or to a cemented pan affect

the construction of grassed waterways. A hazard of soil blowing, low available water capacity, restricted rooting depth, toxic substances such as salts or sodium, and

restricted permeability adversely affect the growth and maintenance of the grass after construction.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey. The data and the estimates of soil and water features listed in tables are explained on the following pages.

Soil properties are determined by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine grain-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties shown in the tables include the range of grain-size distribution and Atterberg limits, the engineering classification, and the physical and chemical properties of the major layers of each soil. Pertinent soil and water features also are given.

Engineering Index Properties

Table 15, "Engineering Index Properties" gives estimates of the engineering classification and of the range of index properties for the major layers of each soil in the survey area. Most soils have layers of contrasting properties within the upper 5 or 6 feet.

Depth to the upper and lower boundaries of each layer is indicated. The range in depth and information on other properties of each layer are given in the series descriptions in Part I of this survey.

Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is as much as 15 percent, an appropriate modifier is added, for example, "gravelly." Textural terms are defined in the "Glossary."

Classification of the soils is determined according to the system adopted by the American Association of State Highway and Transportation Officials (1) and the Unified soil classification system (2).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to grain-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, SP-SM.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of grain-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an oven-dry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and plasticity index (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of grain-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries, the classification in the marginal zone is omitted in the table.

Physical and Chemical Properties

Tables 16, "Physical Properties of the Soils," and table 17, "Chemical Properties of the Soils," show estimates of some characteristics and features that affect soil behavior. These estimates are given for the major layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated. The range in depth and information on other properties of each layer are given in the series descriptions in Part I of this survey.

Clay as a soil separate, or component, consists of mineral soil particles that are less than 0.002 millimeter in diameter. The estimated clay content of each major soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay greatly affect the fertility and physical condition of the soil. They determine the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earth-moving operations.

Moist bulk density is the weight of soil (oven-dry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at 1/3-bar moisture tension. Weight is determined after drying the soil at 105 degrees C. In the table "Physical Properties of the Soils," the estimated moist bulk density of each major soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter.

Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. A bulk density of more than 1.6 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Permeability refers to the ability of a soil to transmit water or air. The estimates indicate the rate of downward movement of water when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each major soil layer. The capacity varies depending on soil properties that affect the retention of water and the depth of the root zone. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Shrink-swell potential is the potential for volume change in a soil with a loss or gain in moisture. Volume change occurs mainly because of the interaction of clay minerals

with water and varies with the amount and type of clay minerals in the soil. The size of the load on the soil and the magnitude of the change in soil moisture content influence the amount of swelling of soils in place. Laboratory measurements of swelling of undisturbed clods were made for many soils. For others, swelling was estimated on the basis of the kind and amount of clay minerals in the soil and on measurements of similar soils.

If the shrink-swell potential is rated moderate to very high, shrinking and swelling can cause damage to buildings, roads, and other structures. Special design is often needed.

Shrink-swell potential classes are based on the change in length of an unconfined clod as moisture content is increased from air-dry to field capacity. The classes are *low*, a change of less than 3 percent; *moderate*, 3 to 6 percent; and *high*, more than 6 percent. *Very high*, more than 9 percent, is sometimes used.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In table 16, "Physical Properties of Soils," the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained or increased by returning crop residue to the soil. Organic matter affects the available water capacity, infiltration rate, and tilth. It is a source of nitrogen and other nutrients for crops.

Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) to predict the average rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, very fine sand, sand, and organic matter (as much as 4 percent) and on soil structure and permeability. The estimates are modified by the presence of rock fragments. Values of K range from 0.02 to 0.69. The higher the value, the more susceptible the soil is to sheet and rill erosion.

Erosion factor K_f indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor T is an estimate of the maximum average rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their resistance to soil blowing in cultivated areas. The groups indicate the susceptibility of soil to soil blowing. Soils are grouped according to the following distinctions:

1. Coarse sands, sands, fine sands, and very fine sands. These soils generally are not suitable for crops. They are extremely erodible and vegetation is difficult to establish.
2. Loamy coarse sands, loamy sands, loamy fine sands, loamy very fine sands, and sapric soil material. These soils are very highly erodible. Crops can be grown if intensive measures to control soil blowing are used.
3. Coarse sandy loams, sandy loams, fine sandy loams, and very fine sandy loams. These soils are highly erodible. Crops can be grown if intensive measures to control soil blowing are used.
- 4L. Calcareous loams, silt loams, clay loams, and silty clay loams that have more than 5 percent finely divided calcium carbonate. These soils are highly erodible. Crops

can be grown if intensive measures to control soil blowing are used.

4. Clays, silty clays, noncalcareous clay loams, and silty clay loams that are more than 35 percent clay. These soils are moderately erodible. Crops can be grown if measures to control soil blowing are used.

5. Noncalcareous loams and silt loams that are less than 20 percent clay and sandy clay loams, sandy clays, and hemic soil material. These soils have less than 5 percent finely divided calcium carbonate. These soils are moderately erodible. Crops can be grown if measures to control soil blowing are used.

6. Noncalcareous loams and silt loams that are more than 20 percent clay and noncalcareous clay loams that are less than 35 percent clay. These soils have less than 5 percent finely divided calcium carbonate. These soils are moderately erodible. Crops can be grown if ordinary measures to control soil blowing are used.

7. Silts, noncalcareous silty clay loams that are less than 35 percent clay, and fibric soil material. These soils have less than 5 percent finely divided calcium carbonate. These soils are very slightly erodible. Crops can be grown if ordinary measures to control soil blowing are used.

8. Soils that are not subject to soil blowing because of rock fragments on the surface or because of surface wetness.

Wind erodibility index is a numerical value indicating the susceptibility of soil to soil blowing, or the tons per acre per year that can be expected to be lost to soil blowing. There is a close correlation between soil blowing and the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence soil blowing.

Cation-exchange capacity is the total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. Soils having a high cation-exchange capacity can retain cations. The ability to retain cations helps to prevent the pollution of ground water.

Soil reaction is a measure of acidity or alkalinity and is expressed as a range in pH values. The range in pH of each major horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Calcium carbonate equivalent is the percent of carbonates, by weight, in the soil. The availability of plant nutrients is influenced by the amount of carbonates in the soil. Incorporating nitrogen fertilizer into calcareous soils helps to prevent nitrite accumulation and ammonium-N volatilization.

Gypsum is given as the percent, by weight, of hydrated calcium sulfates in the soil. Gypsum is partially soluble in water and can be dissolved and removed by water. Soils that have a high content of gypsum (more than 10 percent) may collapse if the gypsum is removed by percolating water.

Salinity is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25

degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of the soil if used as construction material, and the potential of the soil to corrode metal and concrete.

Sodium adsorption ratio is the measure of sodium relative to calcium and magnesium in the water extract from saturated soil paste. Soils having a sodium adsorption ratio of 13 or more may be characterized by an increased dispersion of organic matter and clay particles, reduced permeability and aeration, and a general degradation of soil structure.

Water Features

Table 18, "Water Features" gives estimates of several important water features used in land use planning that involves engineering considerations. These features are described in the following paragraphs.

Hydrologic soil groups are groups of soils that, when saturated, have the same runoff potential under similar storm and ground cover conditions. The soil properties that affect the runoff potential are those that influence the minimum rate of infiltration in a bare soil after prolonged wetting and when the soil is not frozen. These properties include the depth to a seasonal high water table, the intake rate, permeability after prolonged wetting, and the depth to a very slowly permeable layer. The influences of ground cover and slope are treated independently and are not taken into account in hydrologic soil groups.

In the definitions of the hydrologic soil groups, the infiltration rate is the rate at which water enters the soil at the surface and is controlled by surface conditions. The transmission rate is the rate at which water moves through the soil and is controlled by properties of the soil layers.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist chiefly of very deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well or well drained soils that have a moderately fine to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils that have a moderately fine or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clayey soils that have a high shrink-swell potential, soils that have a permanent high water table, soils that have a claypan or clay layer at or near the

surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

Flooding, the temporary covering of the soil surface by flowing water, is caused by overflow from streams or by runoff from adjacent slopes. Shallow water standing or flowing for short periods after rainfall or snowmelt is not considered flooding. Standing water in marshes and swamps or in closed depressions is considered to be ponding.

Table 18, "Water Features," gives the frequency and duration of flooding and the time of year when flooding is most likely to occur. Frequency, duration, and probable dates of occurrence are estimated. Frequency generally is expressed as none, rare, occasional, or frequent. *None* means flooding is not probable; *rare* that it is unlikely but is possible under unusual weather conditions (the chance of flooding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); and *frequent* that it occurs often under normal weather conditions (the chance of flooding is 50 percent in any year). The term *common* includes both frequent and occasional flooding.

Duration is expressed as *very brief* (less than 2 days), *brief* (2 to 7 days), *long* (7 to 30 days), and *very long* (more than 30 days). The time of year that flooding is most likely to occur is expressed in months. About two-thirds to three-fourths of all flooding occurs during the stated period.

The information on flooding is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and level of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

High water table (seasonal) is a zone of saturation at the highest average depth during the wettest season. It is at least 6 inches thick, persists in the soil for more than a few weeks, and is within 6 feet of the surface. Indicated in the table "Water Features," are the depth to the seasonal high water table, the kind of water table, and the months of the year when the water table usually is highest.

An *apparent* water table is indicated by the level at which water stands in a freshly dug, unlined borehole after adequate time for adjustments in the surrounding soil.

A *perched* water table is one that is above an unsaturated zone in the soil. The basis for determining that a water table is perched may be general knowledge of the area. The water table is proven to be perched if the water level in a borehole is observed to fall when the borehole is extended.

Two numbers in the column showing depth to the water table indicate the normal range in depth to a saturated zone. Depth is given to the nearest half foot. The first numeral in the range indicates the highest water level. A plus sign preceding the range in depth indicates that the water table is above the surface of the soil. "More than 6.0" indicates that the water table is below a depth of 6

feet or that it is within a depth of 6 feet for less than a month.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation.

Soil Features

Table 19, "Soil Features," gives estimates of several important soil features used in land use planning that involves engineering considerations. These features are described in the following paragraphs.

Depth to bedrock is given if bedrock is within a depth of 60 inches. The depth is based on many soil borings and on observations during soil mapping. The rock is specified as either soft or hard. If the rock is soft or fractured, excavations can be made with trenching machines, backhoes, or small rippers. If the rock is hard or massive, blasting or special equipment generally is needed for excavation.

A *cemented pan* is a nearly continuous layer of indurated or strongly cemented material that is hard and brittle. The particles are held together by cementing substances, such as calcium carbonate and oxides of silicon, iron, or aluminum. Pans are identified when they are within a depth of 60 inches. They are classified as thin or thick. A *thin* pan can be excavated by trenching machines, backhoes, small rippers, and other equipment commonly used to dig excavations for pipelines, sewer lines, and graves. A *thick* pan is so thick or massive that blasting or special equipment is needed when excavations are made.

Subsidence is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. The table "Soil Features," shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

Potential frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage mainly to pavements and other rigid structures.

A *low* potential for frost action indicates that the soil is rarely susceptible to the formation of ice lenses; a *moderate* potential indicates that the soil is susceptible to formation of ice lenses, resulting in frost heave and the subsequent loss of soil strength; and a *high* potential

indicates that the soil is highly susceptible to formation of ice lenses, resulting in frost heave and the subsequent loss of soil strength.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that dissolves or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil.

Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel in installations that intersect soil boundaries or soil layers is more susceptible to corrosion

than steel in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low, moderate, or high*, is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion is also expressed as *low, moderate, or high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Glossary

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alkali (sodic) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Alluvial cone. The material washed down the sides of mountains and hills by ephemeral streams and deposited at the mouth of gorges in the form of a moderately steep, conical mass descending equally in all directions from the point of issue.

Alluvial fan. The fanlike deposit of a stream where it issues from a narrow valley upon a plain, or of a tributary stream near or at its junction with its main stream.

Alluvial flat. A nearly level, graded, alluvial surface in bolsons and semi-bolsons. Commonly, an alluvial flat does not manifest terraces or floodplain levels.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipyridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Animal unit month (AUM). The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Area reclaim (in tables). An area difficult to reclaim after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Argillite. Weakly metamorphosed mudstone or shale.

Arroyo. The flat-floored channel of an ephemeral stream, commonly with very steep to vertical banks cut in alluvium.

Aspect. The direction in which a slope faces.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic

repeating pattern and defined and delineated as a single map unit.

Available water capacity (available moisture capacity).

The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 3.5
Low	3.5 to 5
Moderate	5 to 7.5
High	more than 7.5

Avalanche chute. The track or path formed by an avalanche.

Back slope. The geomorphic component that forms the steepest inclined surface and principal element of many hillsides. Back slopes in profile are commonly steep, are linear, and may or may not include cliff segments.

Backswamp. A floodplain landform of extensive, marshy, or swampy, depressed areas of flood plains between natural levees and valley sides or terraces.

Badland. Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels. Badland is most common in semiarid and arid regions where streams are entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

Ballena. A fan remnant having a distinctively-rounded surface of fan alluvium. The ballena's broadly rounded shoulders meet from either side to form a narrow summit and merge smoothly with concave, short pediments which form smoothly-rounded drainageways between adjacent ballenas. A partial ballena is a fan remnant large enough to retain some relict fan surface on a remnant summit.

Barrier beach. A wide gently sloping portion of a bolson floor comprising numerous, parallel, relict longshore-bars and lagoons built by a receding pluvial lake.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, K),

- expressed as a percentage of the total cation-exchange capacity.
- Basin floor.** A general term for the nearly level, lower-most part of intermontane basins (i.e., bolson, semi-bolsos). The basin floor includes all of the alluvial, eolian, and erosional landforms below the piedmont slope.
- Beach terrace.** The relict shorelines from pluvial lakes, generally restricted to valley sides.
- Bedding planes.** Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.
- Bedding system.** A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.
- Bedrock.** The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.
- Bedrock-controlled topography.** A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.
- Bench terrace.** A raised, level or nearly level strip of earth constructed on or nearly on a contour, supported by a barrier of rocks or similar material, and designed to make the soil suitable for tillage and to prevent accelerated erosion.
- Bisequum.** Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.
- Blowout.** A shallow depression from which all or most of the soil material has been removed by wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts, the water table is exposed.
- Board foot.** A unit of measure of the wood in lumber, logs, or trees. The amount of wood in a board one foot wide, one foot long, and one inch thick before finishing.
- Bolson.** A landscape term for an internally drained intermontane basin into which drainages from surrounding mountains converge inward toward a central depression.
- Boulders.** Rock fragments larger than 2 feet (60 centimeters) in diameter.
- Breaks.** The steep and very steep broken land at the border of an upland summit that is dissected by ravines.
- Breast height.** An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.
- Brush management.** Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.
- Butte.** An isolated small mountain or hill with steep or precipitous sides and a top variously flat, rounded, or pointed that may be a residual mass isolated by erosion or an exposed volcanic neck.
- Calcareous soil.** A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.
- Caldera.** A large, more or less circular depression, formed by explosion and/or collapse, which surrounds a volcanic vent or vents, and whose diameter is much greater than that of the included vent, or vents.
- Caliche.** A more or less cemented deposit of calcium carbonate in soils of warm-temperate, subhumid to arid areas. Caliche occurs as soft, thin layers in the soil or as hard, thick beds directly beneath the solum, or it is exposed at the surface by erosion.
- California bearing ratio (CBR).** The load-supporting capacity of a soil as compared to that of a standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be supported by standard crushed limestone, per unit area, with the same degree of distortion.
- Canopy.** The leafy crown of trees or shrubs. (See Crown.)
- Canyon.** A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.
- Capillary water.** Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.
- Catena.** A sequence, or "chain," of soils on a landscape that formed in similar kinds of parent material but have different characteristics as a result of differences in relief and drainage.
- Cation.** An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.
- Cation-exchange capacity.** The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.
- Channeled.** Refers to a drainage area in which natural meandering or repeated branching and convergence of a streambed have created deeply incised cuts, either active or abandoned, in alluvial material.
- Channery soil material.** Soil material that is, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.
- Chemical treatment.** Control of unwanted vegetation through the use of chemicals.
- Chiseling.** Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.
- Clay.** As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.
- Clay depletions.** Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the

- removal of iron, manganese, and clay. A type of redoximorphic depletion.
- Clayey soil.** Silty clay, sandy clay, or clay.
- Clay film.** A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.
- Claypan.** A slowly permeable soil horizon that contains much more clay than the horizons above it. A claypan is commonly hard when dry and plastic or stiff when wet.
- Clearcut.** A method of forest harvesting that removes the entire stand of trees in one cutting. Reproduction is achieved artificially or by natural seeding from adjacent stands.
- Climax plant community.** The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.
- Closed depression.** A low area completely surrounded by higher ground and having no natural outlet.
- Coarse fragments.** Mineral or rock particles larger than 2 millimeters in diameter.
- Coarse textured soil.** Sand or loamy sand.
- Cobble (or cobblestone).** A rounded, partly rounded, or angular fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.
- Cobbly soil material.** Material that is 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material is 35 to 60 percent of these rock fragments, and extremely cobbly soil material is more than 60 percent.
- Codominant trees.** Trees whose crowns form the general level of the forest canopy and that receive full light from above but comparatively little from the sides.
- Colluvium.** Unconsolidated, unsorted earth material moved and deposited by mass movement on sideslopes and at the base of slopes.
- Commercial forest.** Forest land capable of producing 20 cubic feet or more per acre per year at the culmination of mean annual increment.
- Complex slope.** Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.
- Complex, soil.** A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.
- Compressible (in tables).** Excessive decrease in volume of soft soil under load.
- Concretions.** Cemented bodies with crude internal symmetry organized around a point, a line, or a plane that typically takes the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.
- Conglomerate.** A coarse grained, clastic rock composed of rounded to subangular rock fragments more than 2 millimeters in diameter. It commonly has a matrix of sand and finer textured material. Conglomerate is the consolidated equivalent of gravel.
- Conservation cropping system.** Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.
- Conservation tillage.** A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.
- Consistence, soil.** Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."
- Contour stripcropping.** Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.
- Control section.** The part of the soil on which classification is based. The thickness varies among different kinds of soil, but, for many, it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.
- Coprogenous earth (sedimentary peat).** Fecal material deposited in water by aquatic organisms.
- Corrosion.** Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.
- Cover crop.** A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.
- Cropping system.** Growing crops according to a planned system of rotation and management practices.
- Crop residue management.** Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.
- Cross-slope farming.** Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.
- Crown.** The upper part of a tree or shrub, including the living branches and their foliage.
- Cuesta.** A hill or ridge that has a gentle slope on one side and a steep slope on the other; specifically, an asymmetric, homoclinal ridge capped by resistant rock layers of slight or moderate dip.
- Culmination of the mean annual increment (CMAI).** The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase.

The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Cutbanks cave (in tables). The walls of excavations tend to cave in or slough.

Decreasers. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

Deep soil. A soil that is 40 to 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.

Delta. A body of alluvium having a surface that is nearly flat and fan shaped, deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.

Dense layer (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depth to rock (in tables). Bedrock is too near the surface for the specified use.

Desert pavement. On a desert surface, a layer of gravel or larger fragments that was emplaced by upward movement of the underlying sediments or that remains after finer particles have been removed by running water or the wind.

Dip slope. A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedrock.

Diversion (or diversion terrace). A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.

Divided-slope farming. A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.

Dominant trees. Trees whose crowns form the general level of the forest canopy and that receive full light from above and from the sides.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized: excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. An area of ground at a lower elevation than the surrounding ground and in which water collects and is drained to a closed depression or lake or to a drainageway at a lower elevation. A drainageway may or may not have distinctly incised channels at its upper reaches or throughout its course.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A mound, ridge, or hill of loose, windblown granular material (generally sand), either bare or covered with vegetation.

Ecological Site. A distinctive kind of rangeland or grazed forestland that has a unique historic potential native plant community. Ecological sites are the products of all the environmental factors that affect their development. An ecological site is capable of supporting a native plant community that has a unique kind and/or proportion of species or total vegetative production. Ecological sites in grazed forestland include both overstory and understory vegetation.

Effervescence. The quality of a soil measured when drops of diluted (1:10) hydrochloric acid (HCL) are added to the soil. The ratings are as follows:

Very slightly effervescent	few bubbles
Slightly effervescent	bubbles readily
Strongly effervescent	bubbles form low foam
Violently effervescent	bubbles form thick foam quickly

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian soil material. Earthy parent material accumulated through wind action; commonly refers to sandy material in dunes or to loess in blankets on the surface.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

- Erosion pavement.** A layer of gravel or stones that remains on the surface after fine particles are removed by sheet or rill erosion.
- Escarpment.** A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Synonym: scarp.
- Even aged.** Refers to a stand of trees in which only small differences in age occur between the individuals. A range of 20 years is allowed.
- Excess alkali** (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.
- Excess fines** (in tables). Excess silt and clay in the soil. The soil does not provide a source of gravel or sand for construction purposes.
- Excess lime** (in tables). Excess carbonates in the soil that restrict the growth of some plants.
- Excess salts** (in tables). Excess water-soluble salts in the soil that restrict the growth of most plants.
- Excess sodium** (in tables). Excess exchangeable sodium in the soil. The resulting poor physical properties restrict the growth of plants.
- Excess sulfur** (in tables). Excessive amount of sulfur in the soil. The sulfur causes extreme acidity if the soil is drained, and the growth of most plants is restricted.
- Extrusive rock.** Igneous rock derived from deep-seated molten matter (magma) emplaced on the earth's surface.
- Fallow.** Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.
- Fan apron.** A sheet-like mantle of relatively young alluvium covering part of an older fan piedmont surface. It somewhere buries a soil that can be traced to the edge of the fan apron.
- Fan piedmont.** The most extensive landform on piedmont slopes, formed by the coalescence of alluvial fans or accretions of fan aprons into one generally smooth slope.
- Fan remnant.** A general term for landforms that are remaining parts of older fan-landforms, that either have been dissected or partially buried.
- Fan skirt.** The zone of smooth, laterally-coalescing, small alluvial fans that issue from gullies cut into the fan piedmont or that are the coalescing extensions of inset fans of the fan piedmont, and that merge with the basin floor.
- Fast intake** (in tables). The rapid movement of water into the soil.
- Fertility, soil.** The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.
- Fibric soil material (peat).** The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.
- Field moisture capacity.** The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.
- Fill slope.** A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.
- Fine textured soil.** Sandy clay, silty clay, or clay.
- Firebreak.** An area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of fire fighters and equipment. Designated roads also serve as firebreaks.
- First bottom.** The normal flood plain of a stream, subject to frequent or occasional flooding.
- Flaggy soil material.** Material that is, by volume, 15 to 35 percent flagstones. Very flaggy soil material is 35 to 60 percent flagstones, and extremely flaggy soil material is more than 60 percent flagstones.
- Flagstone.** A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.
- Flood plain.** A nearly level alluvial plain that borders a stream and is subject to flooding unless protected artificially.
- Fluvial.** Of or pertaining to rivers; produced by river action, as a fluvial plain.
- Foothill.** A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.
- Foot slope.** The inclined surface at the base of a hill.
- Forb.** Any herbaceous plant not a grass or a sedge.
- Forest cover.** All trees and other woody plants (underbrush) covering the ground in a forest.
- Fragile** (in tables). A soil that is easily damaged by use or disturbance.
- Frost action** (in tables). Freezing and thawing of soil moisture. Frost action can damage roads, buildings and other structures, and plant roots.
- Genesis, soil.** The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.
- Gilgai.** The microrelief of clayey soils that shrink and swell considerably with changes in moisture content. Usually manifested as a succession of microbasins and microknolls in nearly level areas or of microvalleys and microridges parallel with the slope.
- Gleyed soil.** Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
- Graded strip cropping.** Growing crops in strips that grade toward a protected waterway.
- Grassed waterway.** A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.
- Gravel.** Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.
- Gravelly soil material.** Material that is 15 to 50 percent, by volume, rounded or angular rock fragments, not

prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

Green manure crop (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.

Ground water. Water filling all the unblocked pores of underlying material below the water table.

Gully. A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Gypsum. A mineral consisting of hydrous calcium sulfate.

Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

Heavy metal. Inorganic substances that are solid at ordinary temperatures and are not soluble in water. They form oxides and hydroxides that are basic. Examples are copper, iron, cadmium, zinc, manganese, lead, and arsenic.

Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

High-residue crops. Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.

Hill. A natural elevation of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and is dependent on local usage.

Holocene. The epoch of the Quaternary Period of geologic time, extending from the end of the Pleistocene Epoch (about 10 to 12 thousand years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. The major horizons of mineral soil are as follows:

O horizon.—An organic layer of fresh and decaying plant residue.

A horizon.—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.—Soft, consolidated bedrock beneath the soil.

R layer.—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasers commonly are the shorter plants and less palatable to livestock.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Inset fan. A special case of the flood plain of an ephemeral stream that is confined between fan remnants, basin-floor remnants, ballenas, or closely opposed fan toeslopes.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermittent stream. A stream, or reach of a stream, that flows for prolonged periods only when it receives groundwater discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intermontane basin. A generic term for wide structural depressions between mountain ranges that are partly filled with alluvium. They may be drained internally (bolsons) or externally (semi-bolsons).

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:

Basin.--Water is applied rapidly to nearly level plains surrounded by levees or dikes.

Border.--Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes or borders.

Controlled flooding.--Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.--Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).--Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.--Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Sprinkler.--Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.--Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.--Water, released at high points, is allowed to flow onto an area without controlled distribution.

Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Lagoon. The nearly level, filled depression behind the longshore bar on a barrier beach.

Lake plain. A surface marking the floor of an extinct lake, filled in by well sorted, stratified sediments.

Lake terrace. The narrow shelf produced along a lake shore and later exposed when the water recedes.

Lamella. A thin, generally horizontal layer of fine material illuviated within a very much thicker, coarser, eluviated layer.

Landform. Any recognizable form or feature on the earth's surface, having a characteristic shape, and produced by natural causes that provide an empirical description of similar portions of the earth's surface.

Landscape. A collection of related, natural landforms.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Large stones (in tables). Rock fragments 3 inches (7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

Leaching. The removal of soluble material from soil or other material by percolating water.

Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy soil. Coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, or silty clay loam.

Loess. Fine grained material, dominantly of silt-sized particles, deposited by wind.

Longshore bar. A narrow, elongate, coarse-textured ridge, built by the wave action of a pluvial lake, that extends parallel to the shore and separated it from a lagoon; both the bar and lagoon are now relict features.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

Low strength. The soil is not strong enough to support loads.

Marl. An earthy, unconsolidated deposit consisting chiefly of calcium carbonate mixed with clay in approximately equal amounts.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Mean annual increment (MAI). The average annual increase in volume of a tree during the entire life of the tree.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Merchantable trees. Trees that are of sufficient size to be economically processed into wood products.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement. Nearly all such rocks are crystalline.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. A soil that is 20 to 40 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance--*few*, *common*, and *many*; size--*fine*, *medium*, and *coarse*; and contrast--*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch), *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch), and *coarse*, more than 15 millimeters (about 0.6 inch).

Mountain. A natural elevation of the land surface, rising more than 1,000 feet above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range.

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

Mudstone. Sedimentary rock formed by induration of silt and clay in approximately equal amounts.

Munsell notation. A designation of color by degrees of three simple variables--hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Natric horizon. A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.

Neutral soil. A soil having a pH value between 6.6 and 7.3. (See Reaction, soil.)

Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and

manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Observed rooting depth. Depth to which roots have been observed to penetrate.

Organic matter. Plant and animal residue in the soil in various stages of decomposition.

Overstory. The trees in a forest that form the upper crown cover.

Oxbow. The horseshoe-shaped channel of a former meander, remaining after the stream formed a cutoff across a narrow meander neck.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan*, *fragipan*, *claypan*, *plowpan*, and *traffic pan*.

Parent material. The unconsolidated organic and mineral material in which soil forms.

Parna dune. An eolian dune built of sand size aggregates of clayey material that commonly occurs leeward of a playa.

Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pediment. A gently sloping erosional surface developed at the foot of a receding hill or mountain slope.

Pedisediment. A thin layer of alluvial material that mantles an erosion surface and has been transported to its present position from higher lying areas of the erosion surface.

Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Percolation. The downward movement of water through the soil.

Percs slowly (in tables). The slow movement of water through the soil adversely affects the specified use.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Extremely slow.....	0.00 to 0.01 inch
Very slow.....	0.01 to 0.06 inch
Slow.....	0.06 to 0.2 inch
Moderately slow.....	0.2 to 0.6 inch

Moderate	0.6 inch to 2.0 inches
Moderately rapid	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

Piedmont slope. The dominant slope at the foot of a mountain. Main components of the piedmont slope include pediments, alluvial fans, fan piedmonts, fan skirts and inset fans.

Piping (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.

Pitting (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.

Plasticity index. The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plateau. An extensive upland mass with relatively flat summit area that is considerably elevated (more than 100 meters) above adjacent lowlands and separated from them on one or more sides by escarpments.

Playa. The generally dry and nearly level lake plain that occupies the lowest parts of closed depressional areas, such as those on intermontane basin floors. Temporary flooding occurs primarily in response to precipitation and runoff.

Pleistocene. The epoch of the Quaternary Period of geologic time preceding the Holocene (from approximately 2 million to 10 thousand years ago).

Plowpan. A compacted layer formed in the soil directly below the plowed layer.

Pluvial. Relating to former periods of abundant rains.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poor filter (in tables). Because of rapid or very rapid permeability, the soil may not adequately filter effluent from a waste disposal system.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Poor outlets (in tables). Refers to areas where surface or subsurface drainage outlets are difficult or expensive to install.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Quartzite, metamorphic. Rock consisting mainly of quartz that formed through recrystallization of quartz-rich sandstone or chert.

Quaternary. The period of geologic time, extending from about 2 million years ago to the present and comprising two epochs, the Pleistocene (Ice Age) and Holocene (Recent).

Quartzite, sedimentary. Very hard but unmetamorphosed sandstone consisting chiefly of quartz grains.

Range condition. The present composition of the plant community on a range site in relation to the potential natural plant community for that site. Range condition is expressed as excellent, good, fair, or poor on the basis of how much the present plant community has departed from the potential.

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Range site. An area of rangeland where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. A range site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other range sites in kind or proportion of species or total production.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline	(mildly alkaline) 7.4 to 7.8
Moderately alkaline	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of

iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regeneration. The new growth of a natural plant community, developing from seed.

Regolith. The unconsolidated mantle of weathered rock and soil material on the earth's surface; the loose earth material above the solid rock.

Relict stream terrace. One of a series of platforms in or adjacent to a stream valley that formed prior to the current stream system.

Relief. The elevations or inequalities of a land surface, considered collectively.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Rill. A steep-sided channel resulting from accelerated erosion. A rill is generally a few inches deep and not wide enough to be an obstacle to farm machinery.

Riverwash. Unstable areas of sandy, silty, clayey, or gravelly sediments. These areas are flooded, washed, and reworked by rivers so frequently that they support little or no vegetation.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bare bedrock other than lava flows and rock-lined pits.

Rooting depth (in tables). Shallow root zone. The soil is shallow over a layer that greatly restricts roots.

Root zone. The part of the soil that can be penetrated by plant roots.

Rubble land. Areas that have more than 90 percent of the surface covered by stones or boulders. Voids contain no soil material and virtually no vegetation other than lichens. The areas commonly are at the base of mountain slopes, but some are on mountain slopes as deposits of cobbles, stones, and boulders left by Pleistocene glaciation or by periglacial phenomena.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called groundwater runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium.

Salinity. The electrical conductivity of a saline soil. It is expressed, in millimhos per centimeter, as follows:

Nonsaline	0 to 2
Very slightly saline	2 to 4
Slightly saline	4 to 8
Moderately saline	8 to 16
Strongly saline	More than 16

Salty water (in tables). Water that is too salty for consumption by livestock.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sand sheet. A large, irregularly shaped, surficial mantle of eolian sand.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy soil. Sand or loamy sand.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Unconsolidated residual material underlying the soil and grading to hard bedrock below.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Sawlogs. Logs of suitable size and quality for the production of lumber.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Scribner's log rule. A method of estimating the number of board feet that can be cut from a log of a given diameter and length.

Second bottom. The first terrace above the normal flood plain (or first bottom) of a river.

Sedimentary rock. Rock made up of particles deposited from suspension in water. The chief kinds of sedimentary rock are conglomerate, formed from gravel; sandstone, formed from sand; shale, formed from clay; and limestone, formed from soft masses of calcium carbonate. There are many intermediate types. Some wind-deposited sand is consolidated into sandstone.

Seepage (in tables). The movement of water through the soil. Seepage adversely affects the specified use.

Semi-bolson. An intermontane basin that is drained externally by an intermittent stream.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock formed by the hardening of a clay deposit.

Shallow soil. A soil that is 10 to 20 inches deep over bedrock or to other material that restricts the penetration of plant roots.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shelterwood system. A forest management system requiring the removal of a stand in a series of cuts so that regeneration occurs under a partial canopy. After regeneration, a final cut removes the shelterwood and allows the stand to develop in the open as an even-aged stand. The system is well suited to sites where shelter is needed for regeneration, and it can aid regeneration of the more intolerant tree species in a stand.

Shoulder slope. The uppermost inclined surface at the top of a hillside. It is the transition zone from the back slope to the summit of a hill or mountain. The surface is dominantly convex in profile and erosional in origin.

Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

Shrub-coppice dune. A small dune that forms around shrubs or small trees.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Siltstone. Sedimentary rock made up of dominantly silt-sized particles.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Sinkhole. A depression in the landscape where limestone has been dissolved.

Site class. A grouping of site indexes into five to seven production capability levels. Each level can be represented by a site curve.

Site curve (50-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for the range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 50 years old or are 50 years old at breast height.

Site curve (100-year). A set of related curves on a graph that shows the average height of dominant or dominant and codominant trees for a range of ages on soils that differ in productivity. Each level is represented by a curve. The basis of the curves is the height of dominant or dominant and codominant trees that are 100 years old or are 100 years old at breast height.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in

a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Skid trails. Pathways along which logs are dragged to a common site for loading onto a logging truck.

Slash. The branches, bark, treetops, reject logs, and broken or uprooted trees left on the ground after logging.

Slickens. Accumulations of fine-textured material, such as material separated in placer-mine and ore-mill operations. Slickens from ore mills commonly consist of freshly ground rock that has undergone chemical treatment during the milling process.

Slickensides. Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.

Slick spot. A small area of soil having a puddled, crusted, or smooth surface and an excess of exchangeable sodium. The soil generally is silty or clayey, is slippery when wet, and is low in productivity.

Slippage (in tables). Soil mass susceptible to movement downslope when loaded, excavated, or wet.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, the following slope classes are recognized:

Nearly level	0 to 2 percent
Gently sloping	2 to 4 percent
Moderately sloping	4 to 8 percent
Strongly sloping	8 to 15 percent
Moderately steep	15 to 30 percent
Steep	30 to 50 percent
Very steep	50 to 75 percent
Extremely steep	75 percent and higher

Slope (in tables). Slope is great enough that special practices are required to ensure satisfactory performance of the soil for a specific use.

Slow intake (in tables). The slow movement of water into the soil.

Slow refill (in tables). The slow filling of ponds, resulting from restricted permeability in the soil.

Small stones (in tables). Rock fragments less than 3 inches (7.6 centimeters) in diameter. Small stones adversely affect the specified use of the soil.

Sodic (alkali) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Sodicity. The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of Na^+ to $\text{Ca}^{++} + \text{Mg}^{++}$. The degrees of sodicity and their respective ratios are:

Very slight	5-12:1
Slight	13-30:1
Moderate	31-45:1

Strong	46-90.1
Very strong	more than 90.1

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Species. A single, distinct kind of plant or animal having certain distinguishing characteristics.

Stone line. A concentration of coarse fragments in a soil. Generally, it is indicative of an old weathered surface. In a cross section, the line may be one fragment or more thick. It generally overlies material that weathered in place and is overlain by recent sediment of variable thickness.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Strath terrace. A surface cut formed by the erosion of hard or semiconsolidated bedrock and thinly mantled with stream deposits.

Stream channel. The hollow bed where a natural stream of surface water flows or may flow; the deepest or central part of the bed, formed by the main current and covered more or less continuously by water.

Stream terrace. One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel. It originally formed near the level of the stream and is the dissected remnants of an abandoned flood plain, streambed, or valley floor that were produced during a former stage of erosion or deposition.

Stripcropping. Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to soil blowing and water erosion.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are: *platy* (laminated), *prismatic*

(vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grain* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

Summit. A general term for the top, or highest level, of an upland feature, such as a hill or mountain. It commonly refers to a higher area that has a gentle slope and is flanked by steeper slopes.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer" or the "Ap horizon."

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

Tailwater. The water directly downstream of a structure.

Talus. Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Terrace. An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field is generally built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace (geologic). A step-like surface, ordinarily flat or undulating, bordering a river, a lake, or the sea representing a former flood plain.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand*, *loamy sand*, *sandy loam*, *loam*,

- silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay, and clay.* The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."
- Thin layer** (in tables). Otherwise suitable soil material too thin for the specified use.
- Till plain.** An extensive area of nearly level to undulating soils underlain by glacial till.
- Tilth, soil.** The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.
- Toe slope.** The outermost inclined surface at the base of a hill; part of a foot slope.
- Too arid** (in tables). The soil is dry most of the time, and vegetation is difficult to establish.
- Topsoil.** The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.
- Toxicity** (in tables). Excessive amount of toxic substances, such as sodium or sulfur, that severely hinder establishment of vegetation or severely restrict plant growth.
- Trace elements.** Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.
- Trafficability.** The degree to which a soil is capable of supporting vehicular traffic across a wide range in soil moisture conditions.
- Tread.** The relatively flat terrace surface that was cut or built by stream or wave action.
- Tuff.** A compacted deposit that is 50 percent or more volcanic ash and dust.
- Understory.** Any plants in a forest community that grow to a height of less than 5 feet.
- Unstable fill** (in tables). Risk of caving or sloughing on banks of fill material.
- Upland** (geology). Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.
- Valley.** An elongated depressional area primarily developed by stream action.
- Valley fill.** In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.
- Variation.** Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.
- Very deep soil.** A soil that is more than 60 inches deep over bedrock or to other material that restricts the penetration of plant roots.
- Very shallow soil.** A soil that is less than 10 inches deep over bedrock or to other material that restricts the penetration of plant roots.
- Water bars.** Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.
- Waterspreading.** Diverting runoff from natural channels by means of a system of dams, dikes, or ditches and spreading it over relatively flat surfaces.
- Water supplying capacity.** The total amount of water available in the soil for plant growth in a normal year from precipitation and from runoff from higher areas. Runoff and water lost to deep percolation are not included.
- Weathering.** All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.
- Well graded.** Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.
- Wilting point (or permanent wilting point).** The moisture content of soil, on an oven-dry basis, at which a plant (specifically, a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.
- Windthrow.** The uprooting and tipping over of trees by the wind.

TABLES

TABLE 1.--TEMPERATURE AND PRECIPITATION

(Recorded in the period 1934-72 at Sheldon, Nevada)

Month	Temperature (Degrees F.)					Precipitation (Inches)				
	Average daily maximum	Average daily minimum	Average daily temperature	2 years in 10 will have--		Average number of growing degree days*	Average	2 years in 10 will have--		Average number of days with 0.10 inch or more
				Maximum temperature higher than	Minimum temperature lower than			less than	more than	
January---	34.1	17.1	25.6	53	-13	2	1.43	0.70	2.06	4
February--	36.2	18.8	27.5	53	-5	3	1.14	0.54	1.66	4
March-----	40.7	20.5	30.6	61	-2	16	1.09	0.58	1.54	4
April-----	50.6	25.7	38.1	71	8	77	0.93	0.44	1.35	3
May-----	59.8	31.9	45.8	78	13	217	1.26	0.59	1.84	4
June-----	67.3	37.2	52.3	86	21	358	1.35	0.43	2.11	4
July-----	78.9	43.7	61.3	91	28	641	0.31	0.11	0.66	0
August----	78.1	43.0	60.6	91	27	617	0.47	0.09	0.93	1
September--	70.3	37.5	53.9	86	16	426	0.47	0.09	0.78	1
October---	57.6	31.2	44.4	78	9	199	0.99	0.32	1.58	2
November--	44.3	24.1	34.2	63	1	39	1.17	0.55	1.83	3
December--	37.2	19.8	28.5	56	-7	6	1.30	0.57	1.92	4
Yearly :										
Average	54.6	29.2	41.9	----	----	----	---	---	---	---
Extreme	100	-29	----	93	-15	----	---	---	---	---
Total	---	---	---	----	----	2,602	11.90	9.38	14.05	34

*A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

TABLE 1.--TEMPERATURE AND PRECIPITATION

(Recorded in the period 1960-80 at Vya, Nevada)

Month	Temperature (Degrees F.)						Precipitation (Inches)			
	Average daily maximum	Average daily minimum	Average daily	2 years in 10 will have--		Average number of growing degree days*	Average	2 years in 10 will have--		Average number of days with 0.10 inch or more

*A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

TABLE 2.--FREEZE DATES IN SPRING AND FALL
(Recorded in the period 1934-72 at Sheldon, Nevada.)

Probability	Temperature		
	24 degrees F. or lower	28 degrees F. or lower	32 degrees F. or lower
Last freezing temperature in spring:			
1 year in 10 later than--	June 19	July 9	July 22
2 years in 10 later than--	June 12	July 3	July 16
5 years in 10 later than--	May 31	June 20	July 5
First freezing temperature in fall:			
1 year in 10 earlier than--	September 1	August 22	August 8
2 years in 10 earlier than--	September 8	August 29	August 14
5 years in 10 earlier than--	September 21	September 12	August 25

TABLE 2.--FREEZE DATES IN SPRING AND FALL
(Recorded in the period 1960-80 at Vya, Nevada.)

Probability	Temperature		
	24 degrees F. or lower	28 degrees F. or lower	32 degrees F. or lower
Last freezing temperature in spring:			
1 year in 10 later than--	May 31	June 9	July 2
2 years in 10 later than--	May 25	June 4	June 26
5 years in 10 later than--	May 13	May 26	June 13
First freezing temperature in fall:			
1 year in 10 earlier than--	September 18	August 30	August 17
2 years in 10 earlier than--	September 23	September 6	August 23
5 years in 10 earlier than--	October 2	September 18	September 3

TABLE 3.--GROWING SEASON

(Recorded in the period 1934-72 at Sheldon, Nevada.)

Daily Minimum Temperature during growing season			
Probability	Higher than 24 degrees F.	Higher than 28 degrees F.	Higher than 32 degrees F.
	Days	Days	Days
9 years in 10	78	47	25
8 years in 10	86	57	33
5 years in 10	103	75	49
2 years in 10	120	93	65
1 year in 10	128	102	73

TABLE 3.--GROWING SEASON

(Recorded in the period 1960-80 at Vya, Nevada.)

Daily Minimum Temperature during growing season			
Probability	Higher than 24 degrees F.	Higher than 28 degrees F.	Higher than 32 degrees F.
	Days	Days	Days
9 years in 10	95	78	54
8 years in 10	104	87	62
5 years in 10	121	102	76
2 years in 10	137	118	91
1 year in 10	146	127	98

TABLE 4.--ACREAGE AND PROPORTIONATE EXTENT OF THE SOILS

Map symbol	Soil name	Acres	Percent
1010	Macyflet-Boulder Lake association-----	4,930	0.7
1011	Macyflet silt loam, 0 to 2 percent slopes-----	440	*
1012	Macyflet-Indian Creek association-----	390	*
1015	Powlow very gravelly loam, 2 to 15 percent slopes-----	3,550	0.5
1020	Bearbutte-Welch association-----	240	*
1025	Mesman fine sandy loam, 0 to 4 percent slopes-----	60	*
1030	Zoravista fine sand, 4 to 15 percent slopes-----	100	*
1035	Ninemile-Madeline-Crocan association-----	9,180	1.3
1036	Tinpan-Ninemile association-----	8,580	1.2
1040	Langston gravelly sandy loam, 2 to 8 percent slopes-----	7,090	1.0
1041	Langston-Old Camp-Paypoint association-----	1,240	0.2
1045	Paypoint-Langston association-----	25,000	3.6
1050	Skullwak silt loam, 0 to 2 percent slopes-----	3,440	0.5
1055	Devada-Hapgood-Hart Camp association-----	3,910	0.6
1060	Bombadil-Chime association-----	1,960	0.3
1061	Old Camp gravelly loam, 8 to 30 percent slopes-----	1,185	0.2
1062	Old Camp-Corral association-----	1,300	0.2
1063	Old Camp very stony loam, 8 to 30 percent slopes-----	3,490	0.5
1065	Old Camp-Reywat-Rubble Land association-----	8,910	1.3
1070	Orenea very gravelly loam, 2 to 15 percent slopes-----	50	*
1075	Surprise gravelly loamy sand, 2 to 15 percent slopes-----	3,650	0.5
1080	Bucklake-Rock Outcrop-Corral association-----	1,950	0.3
1081	Bucklake-Fiddler association-----	3,300	0.5
1083	Bucklake-Rubble Land association-----	5,500	0.8
1090	Jaybee-Verdico association-----	1,610	0.2
1095	Corral-Mahala association-----	1,200	0.2
1105	Fresnik very stony loam, 2 to 15 percent slopes-----	370	*
1110	Indian Creek-Buffaran association-----	1,810	0.5
1115	Lofftus-Mesman complex, 0 to 2 percent slopes-----	40	*
1120	McConnel very stony sandy loam, 2 to 8 percent slopes-----	100	*
1121	McConnel gravelly fine sandy loam, 2 to 8 percent slopes-----	560	*
1125	Halvert-Jaybee-Tunnison association-----	4,490	0.6
1130	Soughe-Rock Outcrop complex, 4 to 30 percent slopes-----	2,130	0.3
1131	Soughe-Rock Outcrop complex, 30 to 50 percent slopes-----	1,320	0.2
1135	Mcwatt-Old Camp association-----	1,380	0.2
1140	Valmy very fine sandy loam, 0 to 2 percent slopes-----	350	*
1141	Valmy-Langston-Paypoint association-----	1,490	0.2
1145	Wendane silt loam, 0 to 2 percent slopes, rarely flooded-----	80	*
1150	Saraph-Hangrock-Tuffo association-----	30,450	4.3
1151	Saraph-Tuffo-Yellowhills association-----	70	*
1155	Madeline-Ninemile complex, 4 to 15 percent slopes-----	240	*
1160	Wyle-Bucklake-Rock Outcrop association-----	6,080	0.9
1162	Devada-Nitpac association-----	2,420	0.3
1163	Devada-Deseed complex, 2 to 15 percent slopes-----	270	*
1164	Devada-Ashcamp association-----	5,660	0.8
1165	Devada-Nitpac-Bidrim association-----	16,930	5.2
1166	Devada-Bieber association-----	30,550	4.3
1167	Devada-Raywat association-----	18,090	2.6
1168	Devada extremely cobbly loam, 4 to 15 percent slopes-----	10,816	1.5
1170	Devada-Bucklake association-----	2,710	0.4
1171	Devada-Indian Creek association-----	2,620	0.4
1172	Devada-Madeline-Ninemile association-----	350	*
1173	Devada-Nitpac-Uhaldi association-----	2,740	0.4
1174	Devada-Uhaldi association-----	1,620	0.2
1175	Ferver-Tunnison association-----	11,720	1.7
1180	Ninemile-Karlo association-----	2,590	0.4
1181	Ninemile-Madeline-Tinpan association-----	15,380	2.2
1182	Ninemile-Westbutte complex, 2 to 15 percent slopes-----	3,780	0.6
1183	Ninemile-Westbutte association, 30 to 50 percent slopes-----	660	*
1184	Ninemile-Tinpan association-----	7,630	1.1
1185	Ninemile-Hart Camp association-----	17,480	2.5

See footnote at end of table.

TABLE 4.--ACREAGE AND PROPORTIONATE EXTENT OF THE SOILS--Continued

Map symbol	Soil name	Acres	Percent
1186	Ninemile-Tinpan-Crocan association-----	20,560	2.9
1187	Ninemile-Tinpan-Hart Camp association-----	6,190	0.9
1188	Ninemile-Newlands-Hart Camp association-----	1,430	0.2
1189	Ninemile-Badgercamp-Crocan association-----	1,240	0.2
1190	Ferver-Nitpac association-----	3,780	0.5
1195	Bitner-Ashcamp association-----	5,820	0.8
1205	Davey loamy fine sand, 2 to 15 percent slopes-----	4,600	0.7

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS

(See text for a description of the limitations and hazards listed in this table)

Soil name and map symbol	Cropland limitations or hazards
1010: Macyflet-----	Short frost-free season Water table
Boulder Lake-----	Ponding Poor tilth Potential for ground-water pollution Short frost-free season Water table
1011: Macyflet-----	Short frost-free season Water table
1012: Macyflet-----	Short frost-free season Water table
Indian Creek-----	Limited available water capacity Restricted permeability Root restrictive layer Short frost-free season Surface rock fragments
1015: Powlow-----	Erosion by water Limited available water capacity Root restrictive layer Slope Surface rock fragments
1020: Bearbutte-----	Erosion by water Limited available water capacity Short frost-free season Slope
Welch-----	Potential for ground-water pollution Short frost-free season Water table
1025: Mesman-----	Limited available water capacity Salt content Sodium content Surface crusting

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1030: Zorravista-----	Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting
1035: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Madeline-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Crocán-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
1036: Tinpan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Surface rock fragments
Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
1040: Langston-----	Limited available water capacity Potential for ground-water pollution Soil blowing

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1041: Langston-----	Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing
Old Camp-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting Surface rock fragments
Paypoint-----	Limited available water capacity Potential for ground-water pollution Soil blowing
1045: Paypoint-----	Limited available water capacity Potential for ground-water pollution Soil blowing
Langston-----	Limited available water capacity Potential for ground-water pollution Soil blowing
1050: Skullwak-----	Flooding Lime content Potential for ground-water pollution Salt content Sodium content Surface crusting Water table

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1055: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Hapgood-----	Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1060: Bombadil-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface stones
Chime-----	Depth to rock Erosion by water Limited available water capacity Slope
1061: Old Camp-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1062: Old Camp-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface crusting Surface rock fragments
Corral-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1063: Old Camp-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting Surface stones
1070: Oreneva-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
1075: Surprise-----	Slope

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1080: Bucklake-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
Rock outcrop-----	Nonsoil material
Corral-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1090: Jaybee-----	Depth to rock Limited available water capacity Potential for ground-water pollution Soil blowing Surface crusting Surface rock fragments
Verdico-----	Depth to rock Erosion by water Limited available water capacity Slope Surface stones
1095: Corral-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Mahala-----	Depth to rock Limited available water capacity Short frost-free season Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1105: Freznik-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
1110: Indian Creek-----	Erosion by water Limited available water capacity Restricted permeability Root restrictive layer Slope Surface rock fragments
Buffaran-----	Erosion by water Limited available water capacity Restricted permeability Root restrictive layer Slope Soil blowing Surface stones
1115: Lofftus-----	Lime content Limited available water capacity Potential for ground-water pollution Root restrictive layer Salt content Sodium content Soil blowing Surface crusting Water table
Mesman-----	Limited available water capacity Salt content Sodium content Surface crusting
1120: McConnel-----	Limited available water capacity Potential for ground-water pollution Salt content Soil blowing Surface stones
1121: McConnel-----	Limited available water capacity Potential for ground-water pollution Salt content Soil blowing Surface crusting

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1125: Halvert-----	Depth to rock Limited available water capacity Root restrictive layer
Jaybee-----	Depth to rock Limited available water capacity Potential for ground-water pollution Soil blowing Surface crusting Surface rock fragments
Tunnison-----	Depth to rock Limited available water capacity Poor tilth Potential for ground-water pollution Soil blowing Surface rock fragments
1130: Soughe-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting Surface rock fragments
Rock outcrop-----	Nonsoil material
1131: Soughe-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting Surface rock fragments
Rock outcrop-----	Nonsoil material

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1135: McWatt-----	Limited available water capacity Potential for ground-water pollution Slope Surface stones
Old Camp-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Surface crusting Surface stones
1140: Valmy-----	Flooding Salt content Sodium content Surface crusting
1141: Valmy-----	Erosion by water Potential for ground-water pollution Salt content Sodium content Surface crusting
Langston-----	Limited available water capacity Potential for ground-water pollution Soil blowing
Paypoint-----	Limited available water capacity Potential for ground-water pollution Soil blowing
1145: Wendane-----	Lime content Potential for ground-water pollution Salt content Sodium content Surface crusting Water table

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1150: Saraph-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing Surface rock fragments
Hangrock-----	Limited available water capacity Root restrictive layer Slope Surface rock fragments
Tuffo-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing Surface rock fragments
1151: Saraph-----	Depth to rock Limited available water capacity Soil blowing
Tuffo-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing
Yellowhills-----	None
1155: Madeline-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1160: Wyro-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Bucklake-----	Areas of rock outcrop Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
Rock outcrop-----	Nonsoil material
1162: Devada-----	Depth to rock Limited available water capacity Potential for ground-water pollution Slope Surface rock fragments
Nitpac-----	Depth to rock Limited available water capacity Root restrictive layer Surface rock fragments
1163: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface rock fragments
Deseed-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1164: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface rock fragments
Ashcamp-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing
1165: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface rock fragments
Nitpac-----	Depth to rock Limited available water capacity Root restrictive layer Slope Surface rock fragments
Bidrim-----	Depth to rock Limited available water capacity Potential for ground-water pollution Slope Surface stones
1166: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Bieber-----	Erosion by water Limited available water capacity Root restrictive layer Short frost-free season Slope Soil blowing Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1167: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Reywat-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
1168: Devada-----	Depth to rock Limited available water capacity Potential for ground-water pollution Slope Surface rock fragments
1170: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Bucklake-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1171: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface stones
Indian Creek-----	Erosion by water Limited available water capacity Restricted permeability Root restrictive layer Slope Surface rock fragments
1172: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Madeline-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1173: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface rock fragments
Nitpac-----	Depth to rock Limited available water capacity Root restrictive layer Slope Surface rock fragments
Uhaldi-----	Depth to rock Erosion by water Limited available water capacity Slope Surface stones
1174: Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface rock fragments
Uhaldi-----	Depth to rock Erosion by water Limited available water capacity Slope Surface stones
1175: Ferver-----	Limited available water capacity Root restrictive layer Surface rock fragments
Tunnison-----	Depth to rock Limited available water capacity Poor tilth Potential for ground-water pollution Soil blowing Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1180: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Karlo-----	Depth to rock Limited available water capacity Poor tilth Potential for ground-water pollution Short frost-free season Surface rock fragments
1181: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Madeline-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Tinpan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1182: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Westbutte-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
1184: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Tinpan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Surface rock fragments
1185: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1186: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Tinpan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Surface rock fragments
Crocan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones
1187: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Tinpan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1188: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Newlands-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Surface stones
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1189: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Badgercamp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Crocan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface stones

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1190: Ferver-----	Erosion by water Limited available water capacity Root restrictive layer Slope Surface rock fragments
Nitpac-----	Depth to rock Limited available water capacity Root restrictive layer Slope Surface rock fragments
1195: Bitner-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing
Ashcamp-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing
1205: Davey-----	Erosion by water Potential for ground-water pollution Slope Soil blowing
1206: Davey-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Soil blowing
Corral-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Soil blowing

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1210: Mazuma-----	Lime content Salt content Sodium content Surface crusting
Bighat-----	Erosion by water Excessive permeability below restriction Lime content Limited available water capacity Potential for ground-water pollution Slope Sodium content Soil blowing Surface crusting Surface stones
1215: Raglan-----	Salt content Sodium content Surface crusting
Isolde-----	Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface crusting
1220: Schamp-----	Erosion by water Short frost-free season Slope Surface stones
1223: Schamp-----	Erosion by water Short frost-free season Slope
1230: Raglan-----	Salt content Sodium content Surface crusting
Mazuma-----	Lime content Salt content Sodium content Surface crusting

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1235: Chime-----	Depth to rock Erosion by water Limited available water capacity Slope
1240: Toney-----	Depth to rock Limited available water capacity Short frost-free season Surface rock fragments
Millerlux-----	Depth to rock Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1245: Saraph-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Soil blowing Surface rock fragments
Uhaldi-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Freintera-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1250: Ashone-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Ashdos-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Bearbutte-----	Erosion by water Limited available water capacity Short frost-free season Slope
1251: Ashone-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Ashdos-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Ashtre-----	Depth to rock Erosion by water Short frost-free season Slope Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1255: Newlands-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Surface stones
Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
1256: Newlands-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Surface stones
Menbo-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
1257: Newlands-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Surface stones
Hapgood-----	Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1258: Newlands-----	Erosion by water Potential for ground-water pollution Short frost-free season Slope Surface stones
Badgercamp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Hackwood-----	Erosion by water Short frost-free season Slope
1270: Hartig-----	Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope
1272: Hartig-----	Areas of rock outcrop Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
Rock outcrop-----	Nonsoil material
1275: Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1277: Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
1278: Boltz-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Soil blowing
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1279: Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Nutzan-----	Depth to rock Erosion by water Short frost-free season Slope Soil blowing
Westbutte-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1285: Zymans-----	Erosion by water Slope Surface rock fragments
Indian Creek-----	Erosion by water Limited available water capacity Restricted permeability Root restrictive layer Slope Surface rock fragments
1286: Zymans-----	Erosion by water Short frost-free season Slope Surface rock fragments
Cotant-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1290: Hapgood-----	Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
Badgercamp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Hackwood-----	Short frost-free season Slope

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1295: Devoy-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
Blizzard-----	Depth to rock Erosion by water Limited available water capacity Poor tilth Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
1296: Blizzard-----	Depth to rock Erosion by water Limited available water capacity Poor tilth Potential for ground-water pollution Short frost-free season Slope Surface rock fragments
1305: Updike-----	Lime content Salt content Sodium content Soil blowing Surface crusting Water table
Mazuma-----	Lime content Salt content Sodium content Surface crusting
1306: Updike-----	Lime content Salt content Sodium content Soil blowing Surface crusting Water table
Longdis-----	Sodium content Surface crusting

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1310: Longdis-----	Sodium content Surface crusting
Updike-----	Flooding Lime content Salt content Sodium content Soil blowing Surface crusting Water table
1311: Longdis-----	Flooding Short frost-free season Sodium content Soil blowing Surface crusting
Macyflet-----	Short frost-free season Water table
Aeric Epiaquents-----	Ponding Potential for ground-water pollution Short frost-free season Surface crusting Water table
1312: Longdis-----	Sodium content Surface crusting
Dugway-----	Root restrictive layer Sodium content Soil blowing Surface crusting Water table
1313: Longdis-----	Flooding Sodium content Soil blowing Surface crusting
1320: Dugway-----	Root restrictive layer Sodium content Soil blowing Surface crusting Water table

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1321: Dugway-----	Root restrictive layer Sodium content Soil blowing Surface crusting Water table
Updike-----	Flooding Lime content Salt content Sodium content Soil blowing Surface crusting Water table
1325: Reywat-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones
Devada-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
Hart Camp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
1326: Reywat-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface stones

Soil name and map symbol	Cropland limitations or hazards
1355: Badgercamp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Hackwood-----	Erosion by water Short frost-free season Slope
Easte-----	Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
1358: Badgercamp-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface stones
Hackwood-----	Erosion by water Short frost-free season Slope
1360: Welch-----	Flooding Potential for ground-water pollution Short frost-free season Water table
1361: Wetvit-----	Flooding Potential for ground-water pollution Water table
Wetvit-----	Flooding Potential for ground-water pollution Water table

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1375: Cotant-----	Depth to rock Erosion by water Limited available water capacity Short frost-free season Slope Surface rock fragments
Madeline-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
1380: Weimer-----	Ponding Poor tilth Potential for ground-water pollution Short frost-free season Water table
Boulder Lake-----	Ponding Poor tilth Potential for ground-water pollution Short frost-free season Water table
1385: Fernpoint-----	Erosion by water Excessive permeability below restriction Limited available water capacity Potential for ground-water pollution Slope Surface rock fragments
1395: Orr-----	None
Fernpoint-----	Erosion by water Excessive permeability below restriction Limited available water capacity Potential for ground-water pollution Slope Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1400: Bombadil-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface stones
Ceejay-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Slope Soil blowing Surface stones
1410: Fulstone-----	Erosion by water Limited available water capacity Root restrictive layer Slope Soil blowing Surface rock fragments
Saraph-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing Surface rock fragments
Tuffo-----	Depth to rock Erosion by water Limited available water capacity Slope Soil blowing Surface rock fragments

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1412: Fulstone-----	Erosion by water Limited available water capacity Root restrictive layer Slope Soil blowing Surface rock fragments
Nellspring-----	Erosion by water Root restrictive layer Slope Soil blowing Surface rock fragments
Buffaran-----	Erosion by water Limited available water capacity Restricted permeability Root restrictive layer Slope Soil blowing
1420: Hangrock-----	Limited available water capacity Root restrictive layer Slope Surface rock fragments
1430: Grassycan-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Root restrictive layer Slope Soil blowing Surface stones
Grassycan-----	Depth to rock Limited available water capacity Potential for ground-water pollution Root restrictive layer Surface stones

TABLE 5.--CROPLAND LIMITATIONS AND HAZARDS--Continued

Soil name and map symbol	Cropland limitations or hazards
1431: Esmod-----	Erosion by water Limited available water capacity Root restrictive layer Slope Soil blowing Surface rock fragments
Powlow-----	Erosion by water Limited available water capacity Root restrictive layer Slope Surface rock fragments
1450: Emagert-----	Water table
Wetvit-----	Flooding Potential for ground-water pollution Water table
1460: Weezweed-----	Water table
1470: Ninemile-----	Depth to rock Erosion by water Limited available water capacity Potential for ground-water pollution Short frost-free season Slope Soil blowing Surface rock fragments
9901: Playas-----	Nonsoil material

TABLE 6.--LAND CAPABILITY AND YIELDS PER ACRE OF CROPS

(Yields are those that can be expected under a high level of irrigated management by component name. Absence of a yield indicates that the soil is not suited to the crop or the crop generally is not grown on the soil)

Map symbol and soil name	Land capability	Alfalfa hay
		Tons
1121: McConnel-----	4S	5.2
1140: Valmy-----	2W	5.0
1215: Raglan-----	2C	---
Isolde-----	4S	4.0
1395: Orr-----	3E	4.5
Fernpoint-----		---

Table 7.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
1010:		
Macyflat-----	Poorly suited-----	Rooting depth.
Boulder Lake-----	Suited-----	Too arid, too clayey.
1011:		
Macyflat-----	Poorly suited-----	Rooting depth.
1012:		
Macyflat-----	Poorly suited-----	Rooting depth.
Indian Creek-----	Poorly suited-----	Droughty, rooting depth.
1015:		
Powlow-----	Poorly suited-----	Droughty, small stones, rooting depth.
1020:		
Bearbutte-----	Suited-----	Too arid.
Welch-----	Well suited-----	
1025:		
Mesman-----	Poorly suited-----	Too arid, droughty, rooting depth.
1030:		
Zorravista-----	Poorly suited-----	Droughty, too sandy, soil blowing.
1035:		
Ninemile-----	Poorly suited-----	Droughty, small stones, rooting depth.
Madeline-----	Poorly suited-----	Rooting depth.
Crocan-----	Poorly suited-----	Droughty, rooting depth.
1036:		
Tinpan-----	Poorly suited-----	Rooting depth.
Ninemile-----	Poorly suited-----	Droughty, small stones, rooting depth.
1040:		
Langston-----	Poorly suited-----	Rooting depth.
1041:		
Langston-----	Poorly suited-----	Rooting depth.
Old Camp-----	Poorly suited-----	Droughty, large stones, rooting depth.
Paypoint-----	Suited-----	Too arid.

Table 7.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
1045:		
Paypoint-----	Suited-----	Too arid.
Langston-----	Poorly suited-----	Rooting depth.
1050:		
Skullwak-----	Poorly suited-----	Rooting depth, excess salt, excess sodium.
1055:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Hapgood-----	Poorly suited-----	Small stones.
Hart Camp-----	Suited-----	Too arid, droughty, depth to rock.
1060:		
Bombadil-----	Poorly suited-----	Droughty.
Chime-----	Suited-----	Too arid, droughty.
1061:		
Old Camp-----	Poorly suited-----	Droughty, large stones.
1062:		
Old Camp-----	Poorly suited-----	Droughty, small stones, rooting depth.
Corral-----	Poorly suited-----	Droughty.
1063:		
Old Camp-----	Poorly suited-----	Droughty, small stones, rooting depth.
1065:		
Old Camp-----	Poorly suited-----	Droughty, small stones, rooting depth.
Keywat-----	Poorly suited-----	Droughty, large stones, rooting depth.
Rubble Land-----	Poorly suited-----	Too arid, droughty, large stones.
1070:		
Oreneva-----	Suited-----	Too arid, droughty.
1075:		
Surprise-----	Suited-----	Too arid, droughty.

Table 7.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
1080:		
Bucklake-----	Poorly suited-----	Small stones.
Rock Outcrop-----	Not rated-----	
Corral-----	Poorly suited-----	Droughty.
1081:		
Bucklake-----	Poorly suited-----	Small stones.
Fiddler-----	Poorly suited-----	Rooting depth.
1083:		
Bucklake-----	Poorly suited-----	Small stones.
Rubble Land-----	Poorly suited-----	Too arid, droughty, large stones.
1090:		
Jaybee-----	Poorly suited-----	Droughty, small stones, rooting depth.
Verdico-----	Poorly suited-----	Rooting depth.
1095:		
Corral-----	Poorly suited-----	Droughty, erodes easily.
Mahala-----	Poorly suited-----	Small stones, rooting depth.
1105:		
Freznik-----	Poorly suited-----	Rooting depth.
1110:		
Indian Creek-----	Poorly suited-----	Droughty, rooting depth.
Buffaran-----	Poorly suited-----	Droughty, rooting depth.
1115:		
Lofftus-----	Poorly suited-----	Droughty, excess salt, excess sodium.
Mesman-----	Poorly suited-----	Too arid, droughty, rooting depth.
1120:		
Mcconnel-----	Poorly suited-----	Small stones, excess salt.
1121:		
Mcconnel-----	Poorly suited-----	Excess salt.

Soil name and map symbol	Limitation rating	Restrictive features
1125:		
Halvert-----	Poorly suited-----	Rooting depth.
Jaybee-----	Poorly suited-----	Droughty, small stones, rooting depth.
Tunnison-----	Poorly suited-----	Too arid.
1130:		
Soughe-----	Poorly suited-----	Droughty, small stones.
Rock Outcrop-----	Not rated-----	
1131:		
Soughe-----	Poorly suited-----	Droughty, small stones.
Rock Outcrop-----	Not rated-----	
1135:		
Mcwatt-----	Poorly suited-----	Droughty, large stones.
Old Camp-----	Poorly suited-----	Droughty, small stones, rooting depth.
1140:		
Valmy-----	Poorly suited-----	Excess salt, excess sodium.
1141:		
Valmy-----	Poorly suited-----	Excess salt, excess sodium.
Langston-----	Poorly suited-----	Rooting depth.
Paypoint-----	Suited-----	Too arid.
1145:		
Wendane-----	Poorly suited-----	Too arid, excess salt, excess sodium.
1150:		
Saraph-----	Poorly suited-----	Droughty.
Hangrock-----	Poorly suited-----	Small stones.
Tuffo-----	Poorly suited-----	Droughty, depth to rock.
1151:		
Saraph-----	Poorly suited-----	Droughty, too sandy.
Tuffo-----	Poorly suited-----	Droughty, depth to rock.
Yellowhills-----	Suited-----	Too arid.

Table 7.--SUITABILITY FOR RANGELAND SEEDING--Continued

Soil name and map symbol	Limitation rating	Restrictive features
1155:		
Madeline-----	Poorly suited-----	Rooting depth.
Ninemile-----	Poorly suited-----	Droughty, small stones, rooting depth.
1160:		
Wylo-----	Poorly suited-----	Droughty, rooting depth.
Bucklake-----	Poorly suited-----	Large stones.
Rock Outcrop-----	Not rated-----	
1162:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Nitpac-----	Poorly suited-----	Small stones, rooting depth.
1163:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Deseed-----	Suited-----	Too arid.
1164:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Ashcamp-----	Poorly suited-----	Droughty.
1165:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Nitpac-----	Poorly suited-----	Small stones, rooting depth.
Bidrim-----	Poorly suited-----	Droughty, rooting depth.
1166:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.
Bieber-----	Poorly suited-----	Droughty, small stones, rooting depth.
1167:		
Devada-----	Poorly suited-----	Droughty, rooting depth.
Raywat-----	Poorly suited-----	Droughty, rooting depth.
1168:		
Devada-----	Poorly suited-----	Droughty, small stones, rooting depth.

1400: Bombadil-----	Severe: depth to rock, slope	Severe: slope, depth to rock	Severe: depth to rock, slope	Severe: slope, depth to rock	Severe: depth to rock, slope	Severe: slope, depth to rock
Ceejay-----	Severe: depth to rock, slope	Severe: shrink-swell, slope, depth to rock	Severe: depth to rock, slope, shrink-swell	Severe: shrink-swell, slope, depth to rock	Severe: depth to rock, shrink-swell, slope	Severe: slope, depth to rock
1410: Pulstone-----	Severe: cemented pan, cutbanks cave	Severe: cemented pan	Severe: cemented pan	Severe: slope, cemented pan	Severe: cemented pan	Severe: small stones, cemented pan
Saraph-----	Severe: depth to rock, slope	Severe: slope	Severe: depth to rock, slope	Severe: slope	Severe: slope	Severe: small stones, slope, depth to rock
Tuffo-----	Severe: depth to rock, slope	Severe: slope	Severe: depth to rock, slope	Severe: slope	Severe: slope	Severe: small stones, slope, depth to rock
1412: Pulstone-----	Severe: cemented pan, cutbanks cave	Severe: cemented pan	Severe: cemented pan	Severe: slope, cemented pan	Severe: cemented pan	Severe: small stones, cemented pan
Nellispring-----	Severe: cemented pan	Severe: shrink-swell	Severe: cemented pan, shrink-swell	Severe: shrink-swell, slope	Severe: shrink-swell, low strength	Severe: small stones
Buffaran-----	Severe: cemented pan	Severe: shrink-swell, cemented pan	Severe: cemented pan, shrink-swell	Severe: shrink-swell, slope, cemented pan	Severe: cemented pan, shrink-swell, low strength	Severe: cemented pan
1420: Hangrock-----	Severe: cemented pan	Moderate: shrink-swell, slope, cemented pan	Severe: cemented pan	Severe: slope	Moderate: cemented pan, shrink-swell, slope	Severe: small stones, cemented pan
1430: Grassycan-----	Severe: depth to rock, cemented pan	Severe: shrink-swell, depth to rock	Severe: depth to rock, cemented pan, shrink-swell	Severe: shrink-swell, slope, depth to rock	Severe: depth to rock, shrink-swell, low strength	Severe: small stones, depth to rock
Grassycan-----	Severe: depth to rock, cemented pan	Severe: shrink-swell, depth to rock	Severe: depth to rock, cemented pan, shrink-swell	Severe: shrink-swell, depth to rock	Severe: depth to rock, shrink-swell, low strength	Severe: small stones, depth to rock
1431: Esmod-----	Severe: cemented pan	Severe: shrink-swell, cemented pan	Severe: cemented pan, shrink-swell	Severe: shrink-swell, slope, cemented pan	Severe: cemented pan, shrink-swell, low strength	Severe: small stones, cemented pan

TABLE 11.--BUILDING SITE DEVELOPMENT--Continued

Map symbol and soil name	Shallow excavations	Dwellings without basements	Dwellings with basements	Small commercial buildings	Local roads and streets	Lawns and landscaping
1431 (con.): Powlow-----	Severe: cemented pan	Severe: shrink-swell	Severe: cemented pan, shrink-swell	Severe: shrink-swell, slope	Severe: shrink-swell, low strength	Severe: small stones, cemented pan
1440: Tusune-----	Severe: slope	Severe: slope	Severe: slope	Severe: slope	Severe: slope	Severe: small stones, slope
Hartig-----	Severe: slope	Severe: slope	Severe: slope	Severe: slope	Severe: slope	Severe: small stones, droughty, slope
1450: Kmagert-----	Severe: cutbanks cave	Severe: flooding	Severe: flooding	Severe: flooding	Severe: frost action	Slight
Wetvit-----	Severe: cutbanks cave, wetness	Severe: flooding, wetness	Severe: flooding, wetness	Severe: flooding, wetness	Severe: wetness, flooding, frost action	Severe: wetness, flooding
1460: Weezweed-----	Severe: cutbanks cave	Severe: flooding	Severe: flooding	Severe: flooding	Severe: frost action	Slight
1470: Ninemile-----	Severe: depth to rock	Severe: shrink-swell, depth to rock	Severe: depth to rock, shrink-swell	Severe: shrink-swell, slope, depth to rock	Severe: depth to rock, shrink-swell, low strength	Severe: large stones, depth to rock
9901: Playas-----	Severe: ponding	Severe: ponding, shrink-swell	Severe: ponding, shrink-swell	Severe: ponding, shrink-swell	Severe: shrink-swell, low strength, ponding	Severe: excess salt, ponding, droughty
9902: Rock Outcrop.						
Rubble Land-----	Severe: large stones, slope	Severe: slope, large stones	Severe: slope, large stones	Severe: slope, large stones	Severe: slope, large stones	Severe: small stones, large stones, droughty

TABLE 12.--SANITARY FACILITIES

(The information in this report indicates the dominant soil condition but does not eliminate the need for onsite investigation)

Map symbol and soil name	Septic tank absorption fields	Sewage lagoon areas	Trench sanitary landfill	Area sanitary landfill	Daily cover for landfill
1010: Macyflat-----	Severe: percs slowly	Moderate: seepage	Severe: wetness	Slight	Poor: hard to pack
Boulder Lake----	Severe: ponding, percs slowly	Severe: ponding	Severe: ponding, too clayey	Severe: ponding	Poor: too clayey, hard to pack, ponding
1011: Macyflat-----	Severe: percs slowly	Moderate: seepage	Severe: wetness	Slight	Poor: hard to pack
1012: Macyflat-----	Severe: percs slowly	Moderate: seepage	Severe: wetness	Slight	Poor: hard to pack
Indian Creek----	Severe: cemented pan, percs slowly	Severe: seepage, cemented pan	Severe: cemented pan	Slight	Poor: cemented pan, seepage, small stones
1015: Powlow-----	Severe: cemented pan	Severe: cemented pan, slope	Severe: too clayey	Severe: cemented pan	Poor: cemented pan, too clayey, hard to pack
1020: Bearbutte-----	Moderate: depth to rock, percs slowly, slope	Severe: slope	Severe: depth to rock	Moderate: depth to rock, slope	Poor: small stones
Welch-----	Severe: wetness, percs slowly	Severe: wetness	Severe: wetness	Severe: wetness	Poor: wetness
1025: Mesman-----	Severe: percs slowly	Moderate: slope	Severe: excess salt	Slight	Good
1030: Zorravista-----	Severe: poor filter	Severe: seepage, slope	Severe: too sandy	Moderate: slope	Poor: seepage, too sandy
1035: Ninemile-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope, too clayey	Severe: depth to rock, slope	Poor: depth to rock, too clayey, hard to pack
Madeline-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope, too clayey	Severe: depth to rock, slope	Poor: depth to rock, too clayey, hard to pack

TABLE 12.--SANITARY FACILITIES--Continued

Map symbol and soil name	Septic tank absorption fields	Sewage lagoon areas	Trench sanitary landfill	Area sanitary landfill	Daily cover for landfill
1035 (con.): Crocan-----	Severe: depth to rock	Severe: depth to rock, slope	Severe: depth to rock, too clayey	Severe: depth to rock	Poor: depth to rock, too clayey, hard to pack
1036: Tinpan-----	Severe: depth to rock, percs slowly	Severe: depth to rock	Severe: depth to rock, too clayey	Severe: depth to rock	Poor: depth to rock, too clayey, hard to pack
Ninemile-----	Severe: depth to rock	Severe: depth to rock, slope	Severe: depth to rock, too clayey	Severe: depth to rock	Poor: depth to rock, too clayey, hard to pack
1040: Langston-----	Severe: poor filter	Severe: seepage	Severe: too sandy	Slight	Poor: seepage, too sandy, small stones
1041: Langston-----	Severe: poor filter	Severe: seepage, slope	Severe: too sandy	Moderate: slope	Poor: seepage, too sandy, small stones
Old Camp-----	Severe: depth to rock	Severe: depth to rock, slope, large stones	Severe: depth to rock, large stones	Moderate: slope	Poor: depth to rock, small stones
Paypoint-----	Severe: poor filter	Severe: seepage	Severe: too sandy	Slight	Poor: seepage, too sandy, small stones
1045: Paypoint-----	Severe: poor filter	Severe: seepage	Severe: too sandy	Slight	Poor: seepage, too sandy, small stones
Langston-----	Severe: poor filter	Severe: seepage	Severe: too sandy	Slight	Poor: seepage, too sandy, small stones
1050: Skullwak-----	Severe: flooding, wetness, percs slowly	Severe: flooding	Severe: flooding, wetness, too clayey	Severe: flooding, wetness	Poor: too clayey, hard to pack, excess sodium
1055: Devada-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope, too clayey	Severe: depth to rock, slope	Poor: depth to rock, too clayey, hard to pack

TABLE 12.--SANITARY FACILITIES--Continued

Map symbol and soil name	Septic tank absorption fields	Sewage lagoon areas	Trench sanitary landfill	Area sanitary landfill	Daily cover for landfill
1055 (con.): Hapgood-----	Severe: slope	Severe: slope	Severe: depth to rock, slope	Severe: slope	Poor: small stones, slope
Hart Camp-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: slope	Poor: depth to rock, small stones, slope
1060: Bombadil-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: slope	Poor: depth to rock, slope
Chime-----	Severe: depth to rock, percs slowly	Severe: depth to rock, slope	Severe: depth to rock	Moderate: slope	Poor: depth to rock
1061: Old Camp-----	Severe: depth to rock, slope	Severe: depth to rock, slope, large stones	Severe: depth to rock, slope, large stones	Severe: slope	Poor: depth to rock, small stones, slope
1062: Old Camp-----	Severe: depth to rock	Severe: depth to rock, slope	Severe: depth to rock	Moderate: slope	Poor: depth to rock, small stones
Corral-----	Severe: depth to rock	Severe: depth to rock, slope	Severe: depth to rock	Moderate: slope	Poor: depth to rock
1063: Old Camp-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: slope	Poor: depth to rock, small stones, slope
1065: Old Camp-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: slope	Poor: depth to rock, small stones, slope
Reywat-----	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Severe: depth to rock, slope	Poor: depth to rock, small stones, slope
Rubble Land-----	Severe: poor filter, slope, large stones	Severe: seepage, slope, large stones	Severe: depth to rock, seepage, slope	Severe: seepage, slope	Poor: seepage, small stones, slope
1070: Oreneva-----	Severe: depth to rock, percs slowly	Severe: depth to rock, slope	Severe: depth to rock	Moderate: slope	Poor: depth to rock, small stones

9901: Playas-----	Poor: shrink-swell, low strength, wetness	Improbable: excess fines	Improbable: excess fines	Poor: too clayey, excess salt, wetness
9902: Rock Outcrop.				
Rubble Land-----	Poor: large stones, slope	Improbable: small stones, large stones	Improbable: large stones	Poor: area reclaim, small stones, slope

TABLE 14.--WATER MANAGEMENT

(The information in this report indicates the dominant soil condition but does not eliminate the need for onsite investigation)

Map symbol and soil name	Limitations for--			Features affecting--		
	Pond reservoir areas	Embankments, dikes, and levees	Aquifer-fed excavated ponds	Drainage	Irrigation	Terraces and diversions
1010: Macyflat-----	Moderate: seepage	Severe: hard to pack	Severe: no water	Deep to water	Percs slowly, erodes easily	Erodes easily, percs slowly
Boulder Lake----	Slight	Severe: hard to pack, ponding	Severe: no water	Ponding, percs slowly	Ponding slow intake, percs slowly	Ponding percs slowly
1011: Macyflat-----	Moderate: seepage	Severe: hard to pack	Severe: no water	Deep to water	Percs slowly, erodes easily	Erodes easily, percs slowly
1012: Macyflat-----	Moderate: seepage	Severe: hard to pack	Severe: no water	Deep to water	Percs slowly, erodes easily	Erodes easily, percs slowly
Indian Creek----	Severe: seepage, cemented pan	Severe: seepage	Severe: no water	Deep to water	Slope, droughty, percs slowly	Large stones, cemented pan, too sandy
1015: Powlow-----	Severe: cemented pan, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, percs slowly, cemented pan	Slope, cemented pan, percs slowly
1020: Bearbutte-----	Severe: slope	Severe: seepage	Severe: no water	Deep to water	Slope, droughty, soil blowing	Slope, soil blowing
Welch-----	Slight	Severe: wetness	Severe: slow refill	Frost action	Wetness	Wetness
1025: Mesman-----	Slight	Severe: piping, excess sodium, excess salt	Severe: no water	Deep to water	Droughty, soil blowing, percs slowly	Erodes easily, soil blowing, percs slowly
1030: Zorravista-----	Severe: seepage, slope	Severe: seepage, piping	Severe: no water	Deep to water	Slope, droughty, fast intake	Slope, too sandy, soil blowing
1035: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Madeline-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, depth to rock, percs slowly

TABLE 14.--WATER MANAGEMENT--Continued

Map symbol and soil name	Limitations for--			Features affecting--		
	Pond reservoir areas	Embankments, dikes, and levees	Aquifer-fed excavated ponds	Drainage	Irrigation	Terraces and diversions
1035 (con.): Crocan-----	Severe: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, depth to rock, percs slowly
1036: Tinpan-----	Moderate: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Depth to rock, erodes easily, percs slowly
Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
1040: Langston-----	Severe: seepage	Severe: seepage	Severe: no water	Deep to water	Slope, droughty	Large stones, too sandy
1041: Langston-----	Severe: seepage, slope	Severe: seepage	Severe: no water	Deep to water	Slope, droughty	Slope, large stones, too sandy
Old Camp-----	Severe: depth to rock, slope	Severe: large stones	Severe: no water	Deep to water	Slope, large stones, droughty	Slope, large stones, depth to rock
Paypoint-----	Severe: seepage	Severe: seepage	Severe: no water	Deep to water	Droughty, soil blowing	Too sandy, soil blowing
1045: Paypoint-----	Severe: seepage	Severe: seepage	Severe: no water	Deep to water	Droughty, soil blowing	Too sandy, soil blowing
Langston-----	Severe: seepage	Severe: seepage	Severe: no water	Deep to water	Slope, droughty	Large stones, too sandy
1050: Skullwak-----	Slight	Severe: wetness, excess sodium, excess salt	Severe: slow refill	Percs slowly, flooding, excess salt	Wetness, percs slowly, erodes easily	Erodes easily, wetness, percs slowly
1055: Devada-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, droughty, percs slowly	Slope, depth to rock, percs slowly
Hapgood-----	Severe: slope	Moderate: thin layer, large stones	Severe: no water	Deep to water	Slope, droughty	Slope, large stones
Hart Camp-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock

Westbutte-----	Severe: slope	Severe: large stones	Severe: no water	Deep to water	Slope, large stones, droughty	Slope, large stones, depth to rock
1183: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Westbutte-----	Severe: slope	Severe: large stones	Severe: no water	Deep to water	Slope, large stones, droughty	Slope, large stones, depth to rock
1184: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Tinpan-----	Moderate: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Depth to rock, erodes easily, percs slowly
1185: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock

TABLE 14.--WATER MANAGEMENT--Continued

Map symbol and soil name	Limitations for--			Features affecting--		
	Pond reservoir areas	Embankments, dikes, and levees	Aquifer-fed excavated ponds	Drainage	Irrigation	Terraces and diversions
1185 (con.): Hart Camp-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock
1186: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Tinpan-----	Moderate: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Depth to rock, erodes easily, percs slowly
Crocán-----	Severe: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, depth to rock, percs slowly
1187: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, large stones, depth to rock
Tinpan-----	Moderate: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Depth to rock, erodes easily, percs slowly
Hart Camp-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock
1188: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Newlands-----	Severe: slope	Moderate: thin layer, piping	Severe: no water	Deep to water	Slope	Slope
Hart Camp-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock
1189: Ninemile-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, large stones, percs slowly	Slope, large stones, depth to rock
Badgercamp-----	Severe: depth to rock, slope	Severe: seepage	Severe: no water	Deep to water	Slope, droughty, depth to rock	Slope, depth to rock
Crocán-----	Severe: depth to rock, slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, depth to rock, percs slowly
1190: Ferver-----	Severe: slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, cemented pan	Slope, cemented pan, erodes easily

TABLE 14.--WATER MANAGEMENT--Continued

Map symbol and soil name	Limitations for--			Features affecting--		
	Pond reservoir areas	Embankments, dikes, and levees	Aquifer-fed excavated ponds	Drainage	Irrigation	Terraces and diversions
1190 (con.): Nitpac-----	Severe: slope	Severe: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, depth to rock	Slope, large stones, depth to rock
1195: Bitner-----	Severe: seepage, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock
Ashcamp-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, depth to rock	Slope, depth to rock
1205: Davey-----	Severe: seepage, slope	Severe: seepage, piping	Severe: no water	Deep to water	Slope, droughty, fast intake	Slope, too sandy, soil blowing
1206: Davey-----	Severe: seepage, slope	Severe: seepage, piping	Severe: no water	Deep to water	Slope, droughty, fast intake	Slope, too sandy, soil blowing
Corral-----	Severe: depth to rock, slope	Severe: thin layer	Severe: no water	Deep to water	Slope, fast intake, soil blowing	Slope, depth to rock, soil blowing
1210: Mazuma-----	Severe: seepage	Severe: piping	Severe: no water	Deep to water	Slope, soil blowing, excess salt	Too sandy, soil blowing
Bighat-----	Severe: seepage, slope	Severe: seepage, excess sodium	Severe: no water	Deep to water	Slope, large stones, droughty	Slope, large stones, too sandy
1215: Raglan-----	Slight	Severe: piping, excess salt	Severe: no water	Deep to water	Soil blowing, erodes easily, excess salt	Erodes easily, soil blowing
Isolde-----	Severe: seepage, slope	Severe: seepage, piping	Severe: no water	Deep to water	Slope, droughty, fast intake	Slope, too sandy, soil blowing
1220: Schamp-----	Severe: seepage, slope	Moderate: hard to pack	Severe: no water	Deep to water	Slope, excess salt	Slope, erodes easily
1221: Schamp-----	Severe: seepage, slope	Moderate: hard to pack	Severe: no water	Deep to water	Slope, excess salt	Slope, erodes easily
1223: Schamp-----	Severe: seepage, slope	Moderate: hard to pack	Severe: no water	Deep to water	Slope, percs slowly, erodes easily	Slope, erodes easily, percs slowly

TABLE 20.--CLASSIFICATION OF THE SOILS

Soil name	Family or higher taxonomic class
Aeric Epiaquents-----	Aeric Epiaquents, frigid
Ashcamp-----	Vitritorrandic Argixerolls, ashy, mesic, shallow
Ashdos-----	Vitritorrandic Argixerolls, ashy, frigid
Ashone-----	Vitritorrandic Argixerolls, ashy, mesic
Ashtre-----	Vitritorrandic Argixerolls, ashy, frigid
Badgercamp-----	Argic Cryoborolls, loamy-skeletal, mixed, shallow
Bearbutte-----	Pachic Argixerolls, coarse-loamy, mixed, frigid
Bidrim-----	Lithic Argixerolls, clayey, montmorillonitic, mesic
Bieber-----	Argiduridic Durixerolls, clayey, montmorillonitic, mesic, shallow
Bighat-----	Typic Natrargids, fine-loamy over sandy or sandy-skeletal, mixed, mesic
Bitner-----	Vitritorrandic Haploxerolls, ashy, mesic
Blizzard-----	Argic Lithic Cryoborolls, clayey, montmorillonitic
Bolts-----	Vitritorrandic Haploxerolls, ashy, frigid
Bombadil-----	Lithic Xeric Haplargids, loamy, mixed, mesic
Boulder Lake-----	Aquic Haploxerolls, fine, montmorillonitic, frigid
Bucklake-----	Aridic Argixerolls, fine, montmorillonitic, mesic
Buffaran-----	Xeric Argidurids, clayey, montmorillonitic, mesic, shallow
Ceejay-----	Xeric Haplargids, clayey, montmorillonitic, mesic
Chime-----	Durynodic Xeric Haplargids, fine-loamy, mixed, mesic
Corral-----	Xeric Haplargids, loamy, mixed, mesic, shallow
Cotant-----	Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Crocan-----	Lithic Argixerolls, clayey, montmorillonitic, frigid
Davey-----	Xeric Haplocambids, sandy, mixed, mesic
Deseed-----	Xeric Haplargids, fine, montmorillonitic, frigid
Devada-----	Lithic Argixerolls, clayey, montmorillonitic, mesic
Devoy-----	Argic Cryoborolls, clayey-skeletal, montmorillonitic
Dosie-----	Pachic Argixerolls, clayey-skeletal, montmorillonitic, mesic
Dugway-----	Natraxeralfic Natridurids, fine, montmorillonitic, mesic
Easte-----	Pachic Xerumbrepts, loamy-skeletal, mixed, frigid
Emagert-----	Vitritorrandic Haploxerolls, ashy, mesic
Esmod-----	Abruptic Xeric Argidurids, clayey, montmorillonitic, mesic, shallow
Fernpoint-----	Aridic Argixerolls, fine-loamy, mixed, mesic
Ferver-----	Vertic Argidurids, very-fine, montmorillonitic, mesic
Fiddler-----	Typic Argixerolls, clayey-skeletal, montmorillonitic, mesic
Fitzwater-----	Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Frentera-----	Vitritorrandic Haploxerolls, ashy, frigid
Freznik-----	Xeric Paleargids, fine, montmorillonitic, frigid
Fulstone-----	Abruptic Xeric Argidurids, clayey, montmorillonitic, mesic, shallow
Grassycan-----	Abruptic Xeric Argidurids, clayey, montmorillonitic, mesic, shallow
Hackwood-----	Pachic Cryoborolls, fine-loamy, mixed
Halvert-----	Vertic Durixerolls, very-fine, montmorillonitic, mesic
Hangrock-----	Haploxeralfic Argidurids, ashy, mesic, shallow
Hapgood-----	Pachic Cryoborolls, loamy-skeletal, mixed
Hart Camp-----	Aridic Argixerolls, loamy, mixed, frigid, shallow
Hartig-----	Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Indian Creek-----	Xeric Argidurids, clayey, montmorillonitic, mesic, shallow
Isolde-----	Typic Torripsamments, mixed, mesic
Jaybee-----	Lithic Xeric Haplargids, loamy, mixed, mesic
Karlo-----	Leptic Haploxerolls, very-fine, montmorillonitic, frigid
Langston-----	Xeric Haplargids, fine-loamy over sandy or sandy-skeletal, mixed, mesic
Layview-----	Argic Lithic Cryoborolls, loamy-skeletal, mixed
Lofftus-----	Aquicambidic Haplodurids, ashy, mesic
Longdis-----	Xeric Natrargids, fine, montmorillonitic, mesic
Macyflet-----	Vertic Paleargids, very-fine, montmorillonitic, frigid
Madelaine-----	Lithic Argixerolls, clayey, montmorillonitic, frigid
Mahala-----	Vertic Paleargids, fine, montmorillonitic, mesic
Maruma-----	Typic Torriorthants, coarse-loamy, mixed (calcareous), mesic
McConnel-----	Xeric Haplocambids, sandy-skeletal, mixed, mesic

TABLE 20.--CLASSIFICATION OF THE SOILS--Continued

Soil name	Family or higher taxonomic class
Mcwatt-----	Xeric Haplocambids, sandy-skeletal, mixed, mesic
Menbo-----	Pachic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Mesman-----	Xeric Natrargids, fine-loamy, mixed, mesic
Millerlux-----	Lithic Xeric Haplargids, clayey, montmorillonitic, frigid
Nellspring-----	Vertic Argidurids, fine, montmorillonitic, mesic
Newlands-----	Argic Cryoborolls, fine-loamy, mixed
Ninemile-----	Lithic Argixerolls, clayey, montmorillonitic, frigid
Nitpac-----	Vertic Durixerolls, fine, montmorillonitic, mesic
Nutran-----	Vitritorrandic Haploxerolls, ashy-skeletal, frigid
Old Camp-----	Lithic Xeric Haplargids, loamy-skeletal, mixed, mesic
Oreneva-----	Xeric Haplocambids, loamy-skeletal, mixed, frigid
Orr-----	Aridic Argixerolls, fine-loamy, mixed, mesic
Paypoint-----	Durinodic Xeric Haplargids, ashy over sandy or sandy-skeletal, mixed, mesic
Powlow-----	Argidic Durixerolls, clayey, montmorillonitic, mesic, shallow
Raglan-----	Durinodic Haplocambids, fine-loamy, mixed, mesic
Reywat-----	Lithic Argixerolls, loamy-skeletal, mixed, mesic
Saraph-----	Vitrikerandic Haplargids, ashy, mesic, shallow
Schamp-----	Xeric Haplargids, fine, montmorillonitic, mesic
Skullwak-----	Aeric Halaquepts, fine, montmorillonitic (calcareous), mesic
Soughe-----	Lithic Xeric Haplargids, loamy-skeletal, mixed, mesic
Surprise-----	Aridic Haploxerolls, coarse-loamy, mixed, mesic
Tinpan-----	Vertic Palexerolls, very-fine, montmorillonitic, frigid
Toney-----	Vertic Paleargids, fine, montmorillonitic, frigid
Tuffo-----	Vitrandic Torriorthents, ashy, nonacid, mesic, shallow
Tunnison-----	Aridic Haploxererts, very-fine, montmorillonitic, mesic
Tusune-----	Vitrandic Cryoborolls, ashy-skeletal
Uhaldi-----	Aridic Argixerolls, fine-loamy, mixed, mesic
Updike-----	Typic Natrargids, fine, montmorillonitic, mesic
Valmy-----	Haploduridic Torriorthents, coarse-loamy, mixed (calcareous), mesic
Verdico-----	Vertic Paleargids, fine, montmorillonitic, mesic
Weezweed-----	Vitritorrandic Haploxerolls, ashy, mesic
Weimer-----	Xeric Epiaquerts, very-fine, montmorillonitic, frigid
Welch-----	Cumulic Endoaquolls, fine-loamy, mixed, frigid
Wendana-----	Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Westbutte-----	Pachic Haploxerolls, loamy-skeletal, mixed, frigid
Wetvit-----	Aquandic Endoaquolls, ashy, mesic
Wylo-----	Lithic Argixerolls, clayey, montmorillonitic, mesic
Yellowhills-----	Vitritorrandic Haploxerolls, ashy, mesic
Zoravista-----	Xeric Torripsamments, mixed, mesic
Zymans-----	Aridic Argixerolls, fine, montmorillonitic, mesic

RANGELAND PLANTS AND WOODLAND UNDERSTORY

1010--MACYFLET-BOULDER LAKE ASSOCIATION

(Absence of an entry indicates that the named plant is not a key species in the potential native plant community)

Common plant name	Plant symbol	Percentage composition and production (dry weight) of plants on major soils and inclusions			
		Soil name or Inclusion number--			
		MACYFLET	BOULDER LAKE	Inclusion 1	Inclusion 2
Cusick bluegrass	POCU3	20-30	---	---	---
Indian ricegrass	ORHY	---	---	---	15-25
Nevada bluegrass	PONE3	2-8	15-35	---	---
Thurber needlegrass	STTH2	25-35	---	5-15	---
basin wildrye	ELCI2	5-15	---	30-40	2-8

NRCS Accessibility Statement

The Natural Resources Conservation Service (NRCS) is committed to making its information accessible to all of its customers and employees. If you are experiencing accessibility issues and need assistance, please contact our Helpdesk by phone at 1-800-457-3642 or by e-mail at ServiceDesk-FTC@ftc.usda.gov. For assistance with publications that include maps, graphs, or similar forms of information, you may also wish to contact our State or local office. You can locate the correct office and phone number at <http://offices.sc.egov.usda.gov/locator/app>.

SOIL LEGEND

Map symbols consist of four digit numbers. The map symbols are not connotative.

SYMBOL	NAME
1010	Macyflet-Boulder Lake association
1011	Macyflet silt loam, 0 to 2 percent slopes
1012	Macyflet-Indian Creek association
1015	Powlow very gravelly loam, 2 to 15 percent slopes
1020	Bearbutte-Welch association
1025	Mesman fine sandy loam, 0 to 4 percent slopes
1030	Zorravista fine sand, 4 to 15 percent slopes
1035	Ninemile-Madeline-Crocan association
1036	Tinpan-Ninemile association
1040	Langston gravelly sandy loam, 2 to 8 percent slopes
1041	Langston-Old Camp-Paypoint association
1045	Paypoint-Langston association
1050	Skullwak silt loam, 0 to 2 percent slopes
1055	Devada-Hapgood-Hart Camp association
1060	Bombadil-Chime association
1061	Old Camp gravelly loam, 8 to 30 percent slopes
1062	Old Camp-Corral association
1063	Old Camp very stony loam, 8 to 30 percent slopes
1065	Old Camp-Reywat-Rubble land association
1070	Oreneva very gravelly loam, 2 to 15 percent slopes
1075	Surprise gravelly loamy sand, 2 to 15 percent slopes
1080	Bucklake-Rock outcrop-Corral association
1081	Bucklake-Fiddler association
1083	Bucklake-Rubble land association
1090	Jaybee-Verdico association
1095	Corral-Mahala association
1105	Freznik very stony loam, 2 to 15 percent slopes
1110	Indian Creek-Bufferan association
1115	Lofftus-Mesman complex, 0 to 2 percent slopes
1120	McConnel very stony sandy loam, 2 to 8 percent slopes
1121	McConnel gravelly fine sandy loam, 2 to 8 percent slopes
1125	Halvert-Jaybee-Tunnison association
1130	Soughe-Rock outcrop complex, 4 to 30 percent slopes
1131	Soughe-Rock outcrop complex, 30 to 50 percent slopes
1135	McWat-Old Camp association
1140	Valmy very fine sandy loam, 0 to 2 percent slopes
1141	Valmy-Langston-Paypoint association
1145	Wendane silt loam, 0 to 2 percent slopes, rarely flooded
1150	Saraph-Hangrock-Tuffo association
1151	Saraph-Tuffo-Yellowhills association
1155	Madeline-Ninemile complex, 4 to 15 percent slopes
1160	Wylo-Bucklake-Rock outcrop association
1162	Devada-Nitpac association
1163	Devada-Deseed complex, 2 to 15 percent slopes
1164	Devada-Ashcamp association
1165	Devada-Nitpac-Bidrim association
1166	Devada-Bieber association
1167	Devada-Reywat association
1168	Devada extremely cobbly loam, 4 to 15 percent slopes
1170	Devada-Bucklake association
1171	Devada-Indian Creek association
1172	Devada-Madeline-Ninemile association
1173	Devada-Nitpac-Uhaldi association
1174	Devada-Uhaldi association
1175	Ferver-Tunnison association
1180	Ninemile-Karlo association
1181	Ninemile-Madeline-Tinpan association
1182	Ninemile-Westbutte complex, 2 to 15 percent slopes
1183	Ninemile-Westbutte association, 30 to 50 percent slopes
1184	Ninemile-Tinpan association
1185	Ninemile-Hart Camp association
1186	Ninemile-Tinpan-Crocan association
1187	Ninemile-Tinpan-Hart Camp association
1188	Ninemile-Newlands-Hart Camp association
1189	Ninemile-Badgercamp-Crocan association
1190	Ferver-Nitpac association
1195	Bitner-Ashcamp association
1205	Davey loamy fine sand, 2 to 15 percent slopes
1206	Davey-Corral association
1210	Mazuma-Bighat association
1215	Raglan-Isolde association

SYMBOL	NAME
1220	Schamp very stony loam, 4 to 15 percent slopes
1221	Schamp very stony loam, 30 to 50 percent slopes
1223	Schamp loam, 4 to 15 percent slopes
1230	Raglan-Mazuma association
1235	Chime gravelly loam, 4 to 15 percent slopes
1240	Toney-Millerlux-Hart Camp association
1245	Saraph-Uhaldi-Fretera association
1250	Ashone-Ashdos-Bearbutte association
1251	Ashone-Ashdos-Ashtre association
1253	Ashdos-Ashtre-Hackwood association
1255	Newlands-Ninemile complex, 4 to 15 percent slopes
1256	Newlands-Menbo association
1257	Newlands-Hapgood association
1258	Newlands-Badgercamp-Hackwood association
1265	Fitzwater-Westbutte association
1270	Hartig gravelly loam, 8 to 30 percent slopes
1271	Hartig-Newlands association
1272	Hartig-Rock outcrop association
1273	Hartig-Hapgood association
1275	Hart Camp stony loam, 8 to 30 percent slopes
1276	Hart Camp-Reywat-Westbutte association
1277	Hart Camp-Ninemile association
1278	Boltz-Hart Camp association
1279	Hart Camp-Nutzan-Westbutte association
1285	Zymans-Indian Creek association
1286	Zymans-Cotant-Hart Camp association
1290	Hapgood-Badgercamp-Hackwood association
1295	Devoy-Blizzard complex, 2 to 15 percent slopes
1296	Blizzard very cobbly silty clay loam, 0 to 15 percent slopes
1305	Udike-Mazuma association
1306	Udike-Longdis association
1310	Longdis-Udike association
1311	Longdis-Macyflet-Aeric epiaquents association
1312	Longdis-Dugway association
1313	Longdis silt loam, 0 to 2 percent slopes
1320	Dugway fine sandy loam, 0 to 2 percent slopes
1321	Dugway-Udike association
1325	Reywat-Devada-Hart Camp association
1326	Reywat very stony loam, 8 to 30 percent slopes
1327	Reywat-Westbutte-Hapgood association
1328	Reywat-Fernpoint association
1329	Reywat-Devada association
1335	Westbutte-Rock outcrop association
1336	Westbutte-Ashtre-Tusune association
1345	Layview-Hapgood association
1346	Layview-Westbutte-Hapgood association
1355	Badgercamp-Hackwood-Easte association, 4 to 30 percent slopes
1356	Badgercamp-Hackwood-Easte association, 30 to 70 percent slopes
1358	Badgercamp-Hackwood association
1360	Welch clay loam, 0 to 4 percent slopes
1361	Wetvit association
1365	Rubble land-Dosie association
1366	Dosie very stony loam, 15 to 50 percent slopes
1367	Dosie-Fiddler-Rubble land association
1375	Cotant-Madeline association
1380	Weimer-Boulder Lake association
1385	Fernpoint very gravelly sandy loam, 8 to 30 percent slopes
1395	Orr-Fernpoint association
1400	Bombadil-Ceejay association
1410	Fulstone-Saraph-Tuffo association
1412	Fulstone-Nellspring-Bufferan association
1420	Hangrock very gravelly loam, 2 to 15 percent slopes
1430	Grassycan association
1431	Esmod-Powlow association
1440	Tusune-Hartig association
1450	Emagert-Wetvit association
1460	Weezweed loam, 0 to 2 percent slopes
1470	Ninemile very cobbly loam, 2 to 15 percent slopes
9901	Playas
9902	Rock outcrop-Rubble land complex, 50 to 75 percent slopes

Pachic Cryoborolls (< 2 acres) quaking aspen woodland

Pachic Xerumbrepts (< 2 acres) white fir woodland

This soil survey was compiled by the U.S. Department of Agriculture, Natural Resources Conservation Service, formerly Soil Conservation Service, and cooperating agencies. Base maps are orthophotographs prepared by the U.S. Department of Interior, Geological Survey, from 1979 aerial photography.

North American Datum of 1927 (NAD27), Clarke 1866 Spheroid
1000-meter ticks: Universal Transverse Mercator, zone 11
Coordinate grid ticks and land division data, if shown, are approximately positioned. Digital data are available for this quadrangle.

INDEX TO ADJOINING 7.5 MAPS

This soil survey was compiled by the U.S. Department of Agriculture, Natural Resources Conservation Service, formerly Soil Conservation Service, and cooperating agencies. Base maps are orthophotographs prepared by the U.S. Department of Interior, Geological Survey, from 1978 aerial photography.

North American Datum of 1927 (NAD27), Clarke 1866 Spheroid 1000-meter ticks: Universal Transverse Mercator, zone 11. Coordinate grid ticks and land division data, if shown, are approximately positioned. Digital data are available for this quadrangle.
